END USER SOFTWARE LICENSE AGREEMENT

IMPORTANT:

This end user software license Agreement (this "Agreement") is a legal agreement between the end user ("Customer") of the software accompanying this Agreement (the "Software") and Meru Networks, Inc. ("Meru"). This Agreement governs Customer's use of, and the term "Software includes, any and all computer software, any printed or electronic documentation, or other code, whether on a disk, in any memory device, embedded in a semiconductor, downloaded or on any other media provided to Customer by Meru Networks, Inc. ("Meru") or its authorized reseller ("Reseller") as part of a Meru product ("Meru Product") or as a stand-alone product. Customer must read this Agreement carefully before installing or otherwise using the Software. By Installing, downloading, embedding or otherwise using the Software, Customer agrees to be bound by the terms of this Agreement. This Agreement provides a license to use the Software and contains warranty disclaimers and liability limitations. By using the software in any way, INCLUDING BUT NOT LIMITED TO, requesting a license key from Meru, Customer confirms its acceptance of, and agreement to be bound by, the terms of this Agreement. If Customer does not agree to be bound by the terms of this Agreement, then Customer must: (i) erase all aspects of the Software from its computers; (ii) not request from Meru or anyone else a license key that would allow operation of the Software; and (iii) not operate the Software in any manner.

Article 1. License

(a).Grant. Subject to Customer's compliance with the terms and conditions in this Agreement, Meru grants Customer a non-exclusive, non-transferable royalty-free license to use the Software exclusively in connection with the Meru Product on which it has been embedded or for which it has been offered, and to use all written materials accompanying the Software (the "Documentation").

1.1. Ownership of Software and Confidentiality.

(a).The Software is licensed, not sold, to Customer by Meru. CUSTOMER MAY OWN THE MEDIA ON WHICH THE SOFTWARE IS PROVIDED, BUT MERU AND/OR MERU'S LICENSOR(S) RETAIN TITLE TO THE SOFTWARE. Customer acknowledges that the Software and Documentation are protected, among other ways, by federal copyright law and international treaties and that they constitute confidential information of Meru, protected also by this Agreement. The organization, structure, sequence, logic and source code of the Software are valuable trade secrets of Meru and its licensors. Except for those rights expressly granted by this Agreement to Customer, Meru or its licensors retain and shall own all rights, title and interests in and to the Software, and Customer shall have no right, title or interest in or to any of, the Software or Documentation, including without limitation, the intellectual property rights comprising or related to the Software and Documentation.

(a).Customer shall keep the Software and Documentation confidential and shall take all reasonable precautions to preserve its confidentiality, including where applicable, having all of its employees and subcontractors execute confidentiality agreements that cover the Software and Documentation. Customer shall take all steps reasonably necessary to ensure that no person or entity has unauthorized access to the Software or Documentation.

1.1. Permitted Uses. This Agreement allows Customer to use the Software solely as embedded in the Meru Product on which the Software has been installed, for execution on, or (where the applicable documentation permits installation on non-Meru equipment) for communication with Meru Product owned or leased by the Customer and in accordance with Meru's documentation. Notwithstanding the restrictions set out above in Section 1.2, Customer may make one copy of any Software that is offered separate from, not embedded in, a Meru Product, in a machine-readable form for back-up purposes only, subject to Customer including on the copy all copyright, trademark and other proprietary rights notices, as contained on the original version. Customer may copy the Documentation in a reasonable number for employees using the Software, subject to Customer including on each copy all copyright, trademark and other proprietary rights notices, as contained in the original version of the Documentation.

1.1. Restrictions on Use. Customer may not, nor may Customer permit any third party to: (a) decompile, reverse engineer, disassemble, or otherwise attempt to derive, reconstruct or discover any humanly readable form of the Software source code; (b) modify, translate, copy, reproduce, disclose, or create derivative works of the Software or Documentation; (c) allow access to the

Software or Documentation by any third party other than agents and representatives working on Customer's behalf; or (d) rent, lease, loan, distribute, assign or transfer the Software unless expressly permitted in writing by Meru or by this Agreement. Customer may not disclose, provide, or otherwise make available any trade secret and/or copyrighted material, including without limitation, the specific design and structure of individual programs or trade secrets, contained within or related to the Software to any third party without Meru's prior written consent. Additionally, Customer shall keep any result of any benchmark or other evaluation of the Software confidential and shall not publish any result of any such result without Meru's prior written consent. Customer will implement reasonable security measures to protect such trade secrets and copyrighted materials. Customer shall not under any circumstance, and shall not permit any third party to, prepare any error correction, modification or derivative work of the Software or Documentation or remove deface or obscure any product identification, copyright, trademark, suppliers' proprietary rights notices, or other notice on or in the Software or on output generated by the Software or the Documentation.

Article 1. Termination. This Agreement is effective until terminated. Customer's rights under this Agreement will terminate automatically without notice from Meru if Customer violates any of the restrictions in Article 1 or breaches any term(s) of this Agreement. Upon termination, Customer must destroy all copies of the Software in Customer's possession or control. Customer acknowledges and agrees that any unauthorized use, transfer, sublicensing or disclosure of the Software may cause irreparable injury to Meru, and under such circumstances, Meru shall be entitled to equitable relief, without posting bond or other security, including but not limited to, preliminary and permanent injunctive relief.

Article 1. Disclaimer of Warranty.

1.1. **TO THE MAXIMUM EXTENT PERMITTED BY LAW, MERU AND MERU 'S LICENSOR(S) (FOR THE PURPOSES OF ARTICLES 3 AND 4, MERU AND MERU 'S LICENSOR(S) SHALL BE COLLECTIVELY REFERRED TO AS "MERU ") PROVIDES THE SOFTWARE AND DOCUMENTATION "AS IS" AND "WITHOUT WARRANTY", AND WITH RESPECT TO THE SOFTWARE AND ANY DOCUMENTATION, MERU HEREBY SPECIFICALLY EXCLUDES AND DISCLAIMS THE IMPLIED WARRANTIES OF MERCHANTABILITY, AND FITNESS FOR A PARTICULAR USE AND ALL OTHER WARRANTIES, WHETHER EXPRESS OR IMPLIED BY LAW, STATUTE OR COURSE OF DEALING, AND MERU SPECIFICALLY EXCLUDES ALL REPRESENTATIONS AND WARRANTIES, WHETHER STATUTORY OR OTHERWISE, WITH RESPECT TO NON-INFRINGEMENT OF ANY NATURE OF THE RIGHTS OF ANY THIRD PARTY.**

1.1. SPECIFICALLY, MERU DOES NOT WARRANT THAT THE FUNCTIONS CONTAINED IN THE SOFTWARE WILL MEET CUSTOMER'S REQUIREMENTS, OR THAT THE OPERATION OF THE SOFTWARE WILL BE UNINTERRUPTED OR ERROR-FREE, OR THAT DEFECTS IN THE SOFTWARE WILL BE CORRECTED. FURTHERMORE, MERU DOES NOT WARRANT OR MAKE ANY REPRESENTATION REGARDING THE USE OR THE RESULTS OF THE USE OF THE SOFTWARE OR RELATED DOCUMENTATION IN TERMS OF THEIR CORRECTNESS, ACCURACY, RELIABILITY, OR OTHERWISE. NO ORAL OR WRITTEN INFORMATION OR ADVICE GIVEN BY MERU OR MERU AUTHORIZED REPRESENTATIVE SHALL CREATE A WARRANTY OR IN ANY WAY INCREASE THE SCOPE OF THIS WARRANTY.

1.1. Meru does not warrant that the Software or any Appliance will be free of vulnerability to intrusion, virus attack or hacker attacks. The Software is not fault-tolerant nor designed or intended for use in hazardous environments requiring fail-safe performance, including without limitation, in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, weapons systems, direct life-support machines or any other application in which the failure of the Software could lead directly to death, personal injury, or severe physical or property damage (collectively, "**High Risk Activities**"). Meru expressly disclaims any express or implied warranty of fitness for High Risk Activities.

Article 1. Limitation of Liability.

1.1. **CUSTOMER ASSUMES THE ENTIRE RISK AS TO RESULTS AND PERFORMANCE OF THE SOFTWARE. TO THE MAXIMUM EXTENT PERMITTED UNDER LAW, UNDER NO CIRCUMSTANCE SHALL MERU BE LIABLE FOR ANY SPECIAL, INDIRECT, INCIDENTAL, EXEMPLARY OR CONSEQUENTIAL DAMAGES OF ANY KIND OR NATURE WHATSOEVER ARISING OUT OF OR IN ANY WAY RELATED TO THIS AGREEMENT OR THE SOFTWARE**. Such limitation of damages includes, but is not limited to, lost good will, lost profits, loss of data or software, work stoppage or impairment of other goods, regardless of the legal theory on which the claim is brought, even if Meru has been advised of the possibility of such damage or if such damage could have been reasonably foreseen, and notwithstanding any failure of essential purpose of any exclusive remedy provided in this Agreement.

1.1. IN NO EVENT SHALL MERU'S TOTAL LIABILITY IN CONNECTION WITH THIS AGREEMENT OR THE SOFTWARE, WHETHER BASED ON CONTRACT, WARRANTY, TORT, INCLUDING NEGLIGENCE, STRICT LIABILITY OR OTHERWISE, EXCEED (i) THE AMOUNT TO MERU FOR THE SOFTWARE LICENSE, OR (ii) IF NO SEPARATE FEE WAS PAID FOR THE SOFTWARE LICENSE, THE AMOUNTS PAID FOR THE MERU PRODUCT IN WHICH THE SOFTWARE IS EMBEDDED. IN NO CASE SHALL MERU BE LIABLE FOR THE COST OF PROCUREMENT OF ANY SUBSTITUTE PRODUCT, SOFTWARE OR SERVICE.

1.1. Customer acknowledges that its agreement to the limitations of liability set out in this article is a crucial part of its consideration for the rights under the license grant.

Article 1. U.S. Government Rights. If Customer is the U.S. Government, Customer acknowledges that it obtains only those rights customarily provided to commercial end use customers. For U.S. governmental entities, this commercial license is provided in accordance with FAR 12.211 (Technical Data) and 12.212 (Computer Software) and, for Department of Defense purchasers, DFAR 252.227-7015 (Technical Data – Commercial Items) and DFAR 227.7202-3 (Rights in Commercial Computer Software or Computer Software Documentation). Use, duplication or disclosure by the U.S. Government is subject to the restrictions

set forth in FAR 52.227-14(g), Rights in Data—General (June 1987) and FAR 52.227-19, Commercial Computer Software—Restricted Rights (June 1987), or if under Department of Defense, DFAR 252.227-7015(b), Technical Data—Commercial Items (June 2004) and DFAR 227.7202-3(a) June 2005) in accordance with this Agreement. If Customer is a governmental entity that has a need for rights not addressed above in this Article 5, it must negotiate a separate agreement with Meru. Customer acknowledges that the Software source code is unpublished and that all rights are reserved under the copyright laws of the United States. Any use, modification, reproduction, display or disclosure of the Software or any documentation by the United States Government shall be governed by the terms of this Agreement.

Article 1. **Export**. The Software may be subject to the United States laws and regulations related to the export of technical data and products produced from such data. Customer shall not, without fully complying with all applicable laws and regulations, including all United States laws and regulations with respect to export, export any Software or any Appliance, allow any Software to be exported or transfer any Software to any person or entity that engages in the research or production of military devices, armaments or any instruments of warfare, including biological, chemical and nuclear warfare.

Article 1. **Governing Law.** This Agreement will be governed by and construed in accordance with the laws of the State of California, U.S.A., without reference to its conflict of law principles, and the United Nations Convention on Contracts for the International Sale of Goods does not apply. Except for actions for injunctive relief for a violation of intellectual property rights or confidentiality obligations, any action by either party with respect to this Agreement or the Software must be brought in the state or federal courts sitting in Santa Clara County, California, and each party submits to the personal jurisdiction of such courts.

Article 1. **Injunctive Relief**. Customer acknowledges that its violation of any restriction set out in Article 1 or of any obligation set out under Article 2 may cause irreparable harm to Meru and upon any such violation, Meru shall be entitled to seek equitable relief without posting any bond or other security.

Article 1. **Entire Agreement; Waiver; Modifications; Severability**. This Agreement constitutes the entire agreement between the parties with respect to the subject matter of this Agreement and supersedes and replaces all prior or contemporaneous understandings or agreements, written or oral, with respect to such subject matter. No modification or amendment of this Agreement or any waiver of any right under this Agreement shall be effective unless in writing and signed by an authorized representative of the party to be charged. Any waiver of any breach of any provision of this Agreement shall not be construed as a waiver of any continuing or succeeding breach of such provision or a waiver or modification of the provision. If a court of competent jurisdiction finds any provision of this Agreement invalid or unenforceable, that provision will be amended to achieve as nearly as possible the same economic effect as the original provision and the remainder of this Agreement will remain in full force. Failure of a party to enforce any provision of this Agreement shall not constitute and shall not be construed as a waiver of such provision or of the right to enforce such provision. CUSTOMER ACKNOWLEDGES THAT IT IS NOT RELYING UPON ANY ORAL REPRESENTATION BY Meru OF ANY NATURE, INCLUDING WITH RESPECT TO ANY WARRANTY.

What is E(z)RF Network Manager? 17

Chapter 3 Managing System Files 19

About the CFS 19
Working with Local Directories 20
Viewing Directory and File Information 20
Changing to Another Directory 21
Working with Configuration Files 22
Changing the Running Configuration 22
Changing the Startup Configuration 23
Manipulating System Files 23
Manipulating Files on a Network Server 23
Remote File Transfer Tasks 24
Copying Files to a Remote Server 24
Displaying a Remote Server's Directory Contents 24
Setting a Remote Username and Password 25
Upgrading System Images 25
Summary of File System Commands 26

Chapter 4 Managing the System 29

Configure Basic Controller Parameters During Setup 29
Configure Controller Parameters From the Web UI 30
Configure UDP Broadcast with Web UI 31
Configure Controller Parameters From the CLI 31
Reset System and System Passwords from the CLI 31
Limit Wireless Client Access to the Controller From the CLI 32
Limit Wired Client Access to the Controller With QoS Rules 33
Configuring UDP Broadcast From the CLI 34
Configure Time Services From the CLI 35
Configure a Controller Index with the CLI 35
System Licensing 35
Configure a License with the Web UI 36
Configure a License with the Web UI 36
AP300 Licensing Changed in Release 4.0 and Later 37
Configuring E(z)RF Location Manager 37
Configure E(z)RF Location Manager with the CLI 37
802.11n Video Service Module (ViSM) 38
Implementing ViSM 38
Using AeroScout 39
Configuring AeroScout 40
Location Accuracy 40
Tag Protocol Implementation 41
AeroScout and Rogue Detection 42
AeroScout Syslog Error Messages 43
AeroScout Mobile Unit 43
Configuring AeroScout 45
Configure AeroScout Mobile Unit from AeroScout Engine 45

Chapter 5 Configuring an ESS 49

Add an ESS with the Web UI 50
When is Virtual Cell Really on for an AP? 57
Adding an ESS with the CLI 57
Assigning an ESSID with the CLI 57
Enable and Disable 58
CLI Configuration 58
Security Profiles for an ESS. 60
Configuring CAC for an ESSID AP with the CLI 60
Configuring Beacon Parameters with the CLI 60
Configuring ESSID Broadcasting with the CLI. 61
Configuring ESSID Joining of Access Points with the CLI 62
Configuring Virtual Cell Support 62
Configuring Virtual Cell Support for AP300 or AP400 with Web UI . . . 62
Configuring Virtual Cell Support for AP300 or AP400 with the CLI . . . 63
Configuring Virtual Cell Support for AP150 64
Virtual Port is Now Part of Virtual Cell. 64
Configuring Probe Response Threshold. 65
Change in CLI 65
Configuring Probe Response Threshold: 66
SNRRange 66
GUI Page: 66
Configuring Silent Client Polling with the CLI 66
Configuring Data Transmit Rates with the CLI 67
Assigning a VLAN with the CLI. 68
WMM Features Supported by System Director 69
Configure U-APSD. 70
Virtual Cell Overflow Feature. 70
When Would I Use Virtual Cell Overflow?. 70
Configure Virtual Cell Overflow with the Web UI 71
Configure Virtual Cell Overflow with the CLI 71
Bridging Versus Tunneling 72
Supported Features for Bridged ESS Profiles. 72
Example of Bridged AP Deployment. 73
Configure a Bridged AP 74
When a Bridged AP Loses Controller Contact 74
Multicasting Feature 74
Configuring IGMP Snooping on Controllers and APs 75
Commands to Configure IGMP Snooping 75
Multicast MAC Transparency Feature 76

Enable Multicast From the Web UI . . . 76
Enable Multicast with the CLI . . . 76
View Mapping Between VLANs and ESS Profiles . . . 76
Bridging with AirFortress and AppleTalk . . . 77
FortressTech Layer 2 Bridging . . . 77
AppleTalk Layer 2 Bridging . . . 77
GRE ESSID Feature . . . 77
Band Steering Feature . . . 77
Configure Band Steering with the Web UI . . . 78
Configure Band Steering with the CLI . . . 78
Expedited Forward Override . . . 80
Steps to configure Expedited Forward Override . . . 80
SSID Broadcast for Vport . . . 83
Configuration of SSID Broadcast for Vport . . . 83
Multiple ESSID Mapping . . . 84
Bridged AP300 in a Remote Location . . . 86
Configure Bridged Mode with the Web UI . . . 86
Configure Bridged Mode with the CLI . . . 86
Utilizing Multiple IPs on a Single MAC . . . 87

Chapter 6 Implementing Redundancy . . . 89

Redundant Ethernet . . . 90
Configure Redundant Ethernet Failover With the CLI . . . 91
Recovering From Redundant Ethernet Failover . . . 91
N+1 Redundancy . . . 91
N+1 with Non-Revertive Mode . . . 93
Preparing the Network . . . 93
Configuring the N+1 Clusters . . . 94
Starting N+1 on Master Controllers . . . 95
Configuring N+1 on the Slave Controller . . . 95
Monitoring the N+1 Installation . . . 97
Managing the N+1 Installation . . . 100
Enabling Non-Revertive mode . . . 100
Scheduling revert on Active slave . . . 101
Cancel the Schedule Revert . . . 101
Reverting the Active Slave to Standby . . . 101
Changing the WTR Interval . . . 102
Disabling and Deleting N+1 Master Controllers . . . 102
Stopping N+1 Installations . . . 102
Replacing a Master Controller . . . 103
Working with N+1 Syslog . . . 103
Recovering From N+1 Failover . . . 105
Recovering From N+1 with Dual Ethernet Failover . . . 105
Option 43 . . . 106
AP Aware Redundancy using DHCP Option 43 . . . 106
AP Aware Redundancy using DNS . . . 107

Chapter 7 Configuring Network Interfaces 109

Configuring Basic Networking for the Interface 109
802.11d Support 110
Dual-Ethernet Operation. 110
Configuring Dual Ethernet 110
Configuring a Redundant Interface 111
Configuring an Active Interface 111
Viewing FastEthernet Interface Information 111
Interface and Networking Commands 112

Chapter 8 Configuring Security 113

Configuring Wireless LAN Security 113
Configure a Security Profile With the Web UI 114
Wi-Fi Protected Access (WPA and WPA2) 117
Encryption Support 119
CCMP-AES. 119
TKIP 119
WEP Security Features 119
Operation of the WEP Protocol 120
Limitations of the WEP Protocol. 121
Configure GRE Tunnels 121
Configure a Security Profile With the CLI 124
Configure 802.1X Radius Security With the CLI 125
Example Security Profile with 802.1X Radius 125
802.1X PTK Rekey. 126
802.1X GTK Rekey 126
Configure WPA2 With the CLI 128
Example WPA2 Configuration. 128
Example WPA2-PSK Configuration 129
Configure WPA With the CLI 129
Example CLI WPA Configuration 129
Opportunistic PMK Caching for WPA 130
WPA PTK Rekey 130
WPA GTK Rekey 131
Example WPA-PSK Configuration 131
WPA/WPA-PSK Command Summary. 131
Configure 802.11 WEP Encryption 132
Checking a CLI Configuration 133
Policy Enforcement Module. 135
Configure Firewall Policies with the CLI 135
Troubleshooting Per-User Firewall 136
Proactive Spectrum Manager 137
Configure Proactive Dashboard Manager Using the Web UI 137
Configure Proactive Dashboard Manager Using the CLI 138
RSA SecurID Authentication. 138
RSA SecurID Authenticator Token and Code 139
RSA SecurID Server 139
RSA SecurID Agent. 139

About This Guide

This guide describes the various options for configuring the Meru Wireless LAN System. The architecture and fundamental operations of system are described.

What's New in this 5.1 Edition

The previous edition of this guide covered System Director 5.0. The new or changed topics for this System Director 5.1 version of the Configuration Guide include:

- Batch adding AP-Interfaces to ESS Profile: The user is now allowed to add multiple AP interfaces on the ESS Profile screen, rather than having to do it on a one-by-one basis. Refer to **"Add an ESS with the Web UI" on page 50** for further information.
- A Description field is now added on the MAC Filtering (ACL) Configuration screen. Refer to the **MAC Filtering (ACL) Configuration** topic of the System Director 5.1 Online Help.
- The maximum allowed link-probe duration value has been increased to 32000 minutes. This is implemented in order to help users who have a WAN connectivity issue come up over a weekend, as the previous maximum (7200) would result in system reboots upon returning to the office on Monday. Refer to **"Add and Configure an AP with the Web UI" on page 206** for further configuration details.
- A new field **KeepAlive Timeout(seconds)** is included in the **AP Table - Update** screen. This field has been included to assist with remote AP issues in which an AP in a relatively inaccessibly location would lose connectivity with the main controller and start looking for a new Master too quickly. Users may now specify how long the AP waits before beginning the scanning process. Refer to **"Add and Configure an AP with the Web UI" on page 206** for further information.
- An alarm named **Radio Failure** is generated when the Radio fails to turn operational during Initial bootup. Refer to **"Alarms" on page 319** for further information.
- A new feature **N+1 with Non-Revertive mode** is now introduced to control the fail back operation. Refer to **"N+1 with Non-Revertive Mode" on page 93** for further information.
- A new feature **802.1x Termination** is introduced to perform the configuration on per-security profile basis. This is intended to help users with a deployment that implements the Starnet Radius Server. Refer to **"Configure a Security Profile With the Web UI" on page 114** for further information.

© 2012 Meru Networks, Inc.

- U-APSD support has been added for the AP1000 series. Refer to **“Configure U-APSD” on page 70** for more details.
- DFS support has been added for the AP1000 series. This feature requires no configuration, is always on, and cannot be disabled.
- SIP over TCP communication has been implemented. Refer to **“Optimizing Voice Over IP” on page 241** for additional details on configuring a Voice over IP deployment.
- Several new AP models have been implemented: AP400i, AP400is, OAP433, and AP1000e. See each AP’s individual *Access Point Installation Guide* for details.
- This version of System Director supports the new MC6000 chassis controller. Refer to the *Meru Controller Installation Guide* for controller specifications.

Audience

This guide is intended for network administrators configuring and maintaining the Meru Wireless LAN System. Familiarity with the following concepts is helpful when configuring the Meru Wireless LAN System:

- Network administration, including:
  - Internet Protocol (IP) addressing and routing
  - Dynamic Host Configuration Protocol (DHCP)
  - Configuring Layer 2 and Layer 3 switches (if required by your switch)
- IEEE 802.11 (Wi-Fi) concepts, including:
  - ESSIDs
  - WEP
- Network Security (optional)
  - WPA
  - 802.1X
  - Radius
  - X.509 certificates

 © 2012 Meru Networks, Inc.

Other Sources of Information

Additional information is available in the following Web site, Meru publications, and external references.

Web Resources

For the first 90 days after you buy a Meru controller, you have access to online support. If you have a support contract, you have access for the length of the contract. See this web site for information such as:

- Knowledge Base (Q&A)
- Downloads
- Open a ticket or check an existing one
- Customer Discussion Forum

The URL is: **http://support.merunetworks.com**

Meru Publications

- *Meru System Director Release Notes*
- *Meru Access Point and Radio Switch Installation Guide*
- *Meru Controller Installation Guide*
- *Meru System Director Command Reference*
- *Meru System Director Getting Started Guide*

Guide to Typographic Conventions

This guide uses the following typographic conventions in paragraph text to help you identify information:

Bold text	Identifies commands and keywords in syntax descriptions that are entered literally.
Italic text	Used for new terms, emphasis, and book titles; also identifies arguments for which you supply values in syntax descriptions.

© 2012 Meru Networks, Inc.

`Courier font`	Identifies file names, folder names, computer screen output, and text in syntax descriptions that you are required to type.
`Ctrl-`	Denotes that the Ctrl key should be used in conjunction with another key, for example, Ctrl-D means hold down the Ctrl and press the D key. Keys are shown in capitals, but are not case sensitive.

Note: Provides extra information, tips, and hints regarding the topic

Caution! Identifies important information about actions that could result in damage to or loss of data, or could cause the application to behave in unexpected ways

Warning! Identifies critical information about actions that could result in equipment failure or bodily harm

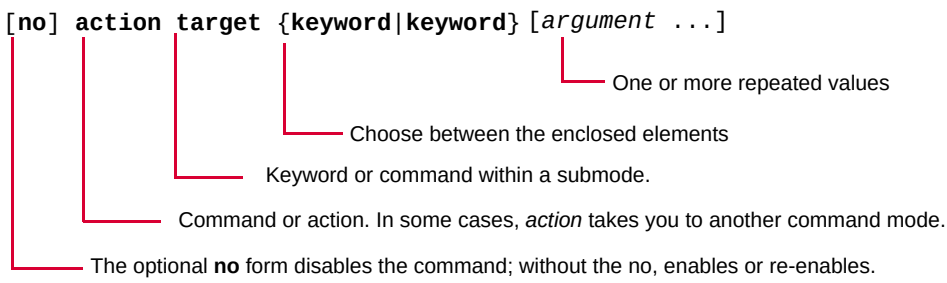
Syntax Notation

In example command syntax descriptions and examples, the following text elements and punctuation are used to denote user input and computer output for the command.

`bold`	Required command, keywords, and punctuation.
`italic`	Arguments or file names where you substitute a value.
no	The optional no form of the command disables the feature or function.
`[ ]`	Optional elements are enclosed by square brackets.
`{ }`	Braces indicates that one of the enclosed elements must be used.
`|`	Choices among elements are separated by vertical bars.
`[{}]`	A required choice within an optional element.
…	The preceding argument can be repeated.

 © 2012 Meru Networks, Inc.

The following figure shows a sample of syntax notation.



[no] action target {keyword|keyword} [argument ...]
One or more repeated values
Choose between the enclosed elements
Keyword or command within a submode.
Command or action. In some cases, action takes you to another command mode.
The optional no form disables the command; without the no, enables or re-enables.

Note: Many commands have a default setting or value, listed in the Default section of the command page.

Contacting Meru

You can visit Meru Networks on the Internet at this URL:

http://www.merunetworks.com

Click the Support menu button to view Meru Customer Services and Support information.

Customer Services and Support

For assistance, contact Meru Customer Services and Support 24 hours a day at +1-888-637-8952 (+1-888-Meru-WLA(N)) or +1-408-215-5305. Email can be sent to support@merunetworks.com.

Meru Customer Services and Support provide end users and channel partners with the following:

- Telephone technical support
- Software update support
- Spare parts and repair service

Chapter 1
CLI Concepts

This chapter presents tips for working with the System Director command line interface (CLI). It describes the various command modes, provides some tips for getting help, using the history functions, and customizing the prompt and terminal characteristics. The following sections are included in this guide:

- **Getting Started**
- **CLI Command Modes**
- **Command Line-Only Commands**
- **Command Line-Only Commands**
- **Abbreviating Commands**
- **Using No and Default Forms of Commands**
- **Getting Help**
- **Using Command History**
- **Finding Words in show Command Output**
- **Customizing the CLI Prompt**
- **Manipulating Terminal Characteristics**
- **Ending a Session**

Getting Started

To start using the Command Line Interface:

1. Connect to the controller using the serial console or Ethernet port, or remotely with a telnet or SSH2 connection once the controller has been assigned an IP address.

   To assign the controller an IP address, refer to the “Initial Setup” chapter of the *Meru System Director Getting Started Guide*.

2. At the login prompt, enter a user ID and password. By default, the `guest` and `admin` user IDs are configured.
   - If you log in as the user `admin`, with the admin password, you are automatically placed in privileged EXEC mode.

© 2012 Meru Networks, Inc.

— If you log in as the user `guest`, you are placed in user EXEC mode. From there, you must type the **enable** command and the password for user `admin` before you can enter privileged EXEC mode.

3. Start executing commands.

CLI Command Modes

The CLI is divided into different command modes, each with its own set of commands and in some modes, one or more submodes. Entering a question mark (**?**) at the system prompt provides a list of commands available at the current mode.

User EXEC Mode

When you start a session on the controller, you begin in user mode, also called user EXEC mode. Only a subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time and display-only commands, such as the **show** commands, which list the current configuration information, and the **clear** commands, which clear counters or interfaces. The user EXEC commands are not saved when the controller reboots.

- Access method: Begin a session with the controller as the user `guest`.
- Prompt: `default>`
- Exit method: Enter either **exit** or **quit**.
- Summary: Use this mode to change console settings, obtain system information such as showing system settings and verifying network connectivity.

Privileged EXEC Mode

To access all the commands in the CLI, you need to be in privileged EXEC mode. You can either log in as `admin`, or enter the **enable** command at the user EXEC mode and provide the `admin` password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter Global Configuration mode.

- Access method: Enter **enable** while in user EXEC mode, or log in as the user `admin`.
- Prompt: `default#`
- Exit method: Enter **disable**.
- Summary: Use this mode to manage system files and perform some troubleshooting. Change the default password (from Global Configuration mode) to protect access to this mode.

 © 2012 Meru Networks, Inc.

Global Configuration Mode

You make changes to the running configuration by using the Global Configuration mode and its many submodes. Once you save the configuration, the settings are stored and restarted when the controller reboots.

From the Global Configuration mode, you can navigate to various submodes (or branches), to perform more specific configuration functions. Some configuration submodes are **security**, **qosrules**, **vlan**, and so forth.

- Description: configures parameters that apply to the controller as a whole.
- Access method: Enter **configure terminal** while in privileged EXEC mode.
- Prompt: `controller(config)#`
- Exit method: enter **exit** or press **Ctrl-Z** to return to privileged EXEC mode (one level back).
- Summary: Use this mode to configure some system settings and to enter additional configuration submodes (**security**, **qosrules**, **vlan**).

Command Line-Only Commands

Many CLI commands have an equivalent functionality in the Web Interface, so you can accomplish a task using either interface. The following lists commands that have no Web Interface functionality.

EXEC Mode Commands

- configure terminal
- no history
- no prompt
- no terminal length |width
- help
- cd
- copy (including copy running-config startup-config, copy startup-config running-config and all local/remote copy)
- delete flash: *image*
- delete *filename*
- dir [*dirname*]
- debug
- disable
- enable

© 2012 Meru Networks, Inc.

- exit
- quit
- more (including more running-config, more l*og-file*, more running-script)
- prompt
- rename
- terminal history|size|length|width
- traceroute
- show history
- show running-config
- show terminal

Config Mode Commands

- do
- ip username ftp|scp|sftp
- ip password ftp|scp|sftp
- show context

Commands that Invoke Applications or Scripts

- calendar set
- timezone set|menu
- date
- capture-packets
- analyze-capture
- debug
- diagnostics[-controller]
- ping
- pwd
- shutdown controller force
- reload controller default
- run
- setup
- upgrade
- downgrade
- poweroff
- show calendar
- show timezones
- show file systems

 © 2012 Meru Networks, Inc.

- show memory
- show cpu-utilization
- show processes
- show flash
- show qosflows
- show scripts
- show station details
- show syslog-host
- show log
- autochannel
- rogue-ap log clear
- telnet
- syslog-host

Abbreviating Commands

You only have to enter enough characters for the CLI to recognize the command as unique. This example shows how to enter the **show security** command, with the command show abbreviated to **sh**:

```
Lab-MC1000# sh security-profile default
Security Profile Table

Security Profile Name : default
L2 Modes Allowed : clear
Data Encrypt : none
Primary RADIUS Profile Name :
Secondary RADIUS Profile Name :
WEP Key (Alphanumeric/Hexadecimal) : *****
Static WEP Key Index : 1
Re-Key Period (seconds) : 0
Captive Portal : disabled
802.1X Network Initiation : off
Tunnel Termination: PEAP, TTLS
Shared Key Authentication : off
Pre-shared Key (Alphanumeric/Hexadecimal) : *****
Group Keying Interval (seconds) : 0
Key Rotation : disabled
Reauthentication : off
MAC Filtering : off
Firewall Capability : none
Firewall Filter ID :
Security Logging : off
Allow mentioned IP/Subnet to pass through Captive portal : 0.0.0.0
```

© 2012 Meru Networks, Inc.

```
Subnet Mask for allowed IP/Subnet to pass through Captive portal : 0.0.0.0
```

Using No and Default Forms of Commands

Almost every configuration command has a **no** form. In general, use the **no** form to:

1. Disable a feature or function.
2. Reset a command to its default values.
3. Reverse the action of a command.
4. Use the command without the **no** form to reenable a disabled feature or to reverse the action of a **no** command.

Configuration commands can also have a **default** form. The **default** form of a command returns the command setting to its default. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** command enables the command and sets variables to their default values. The reference page for the command describes these conditions.

Getting Help

Entering a question mark (**?**) at the system prompt displays a list of commands for each command mode. When using context-sensitive help, the space (or lack of a space) before the question mark (**?**) is significant. To obtain a list of commands that begin with a particular character sequence, enter those characters followed immediately by the question mark (**?**). Do not include a space. This form of help is called word help, because it completes a word for you.

 © 2012 Meru Networks, Inc.

To list keywords or arguments, enter a question mark (**?**) in place of a keyword or argument. Include a space before the **?**. This form of help is called command syntax help, because it reminds you which keywords or arguments are applicable based on the command, keywords, and arguments you already have entered.

Table 1: Examples of Help Commands

Command	Purpose
(prompt)# **help**	Displays a brief description of the help system.
(prompt) # *abbreviated-command***?**	Lists commands in the current mode that begin with a particular character string.
(prompt)# *abbreviated-command*<Tab>	Completes a partial command name
(prompt)# **?**	Lists all commands available in command mode
(prompt)# *command***?**	Lists the available syntax options (arguments and keywords) for the command.
(prompt)# *command keyword* **?**	Lists the next available syntax for this command.

The prompt displayed depends on the configuration mode.

You can abbreviate commands and keywords to the number of characters that allow a unique abbreviation. For example, you can abbreviate the **configure terminal** command to **config t**.

Entering the **help** command will provide a description of the help system. This is available in any command mode.

Using Command History

The CLI provides a history of commands that you have entered during the session. This is useful in recalling long and complex commands, and for retyping commands with slightly different parameters. To use the command history feature, you can perform the following tasks:

- Set the command history buffer size

© 2012 Meru Networks, Inc.

- Recall commands
- Disable the command history feature

Setting the Command History Buffer Size

By default, the CLI records ten command lines in its history buffer. To set the number of command lines that the system will record during the current terminal session, and enable the command history feature, use the **terminal history** command:

```
controller# terminal history [size n]
```

The **terminal no history size** command resets the number of lines saved in the history buffer to the default of ten lines or number specified by size.

To display the contents of the history buffer, type **default history**:

```
controller# default history
```

To display the contents of the history buffer, type **terminal history**

```
controller# terminal history
    7 interface Dot11Radio 1
    8 end
    9 interface Fast Ethernet controller 1 2
   10 show interface Dot11Radio 1
   11 end
   12 show interfaces FastEthernet controller 1 2
   13 sh alarm
   14 sh sec
   15 sh security
```

Recalling Commands

To recall commands from the history buffer, use one of the following commands or key combinations:

- **Ctrl-P** or **Up Arrow** key. This recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.
- **Ctrl-N** or **Down Arrow** key. Returns to more recent commands in the history buffer after recalling commands with Ctrl-P or the Up Arrow key.
- **!***number*. Execute the command at the history list *number*. Use the **terminal history** or **show history** commands to list the history buffer, then use this command to re-execute the command listed by its sequence number.
- To list the contents of the history buffer, use the **show history** command:

  ```
  controller# show history
  ```

 © 2012 Meru Networks, Inc.

Disabling the Command History Feature

The terminal history feature is automatically enabled. To disable it during the current terminal session, type **no terminal history** in either privileged or non-privileged EXEC mode:

```
controller# no terminal history
```

Finding Words in show Command Output

To quickly locate a word in the output of any **show** command, use the following command:

show *argument* **| grep** "*string*"

For this feature to work, only one **show** command can be the input to the **grep** and the **show** command cannot have arguments (for example, the form of the command such as **show ap 54**. The "*string*" is a literal, case-sensitive word to search for (such as AP-54), and must be enclosed in double quotation marks. Only one string search can be performed per command line.

As an example, to search for and display the entry for AP-54 in the output of the **show ap** command, use the command:

```
controller# show ap | grep "AP-54"

AP ID AP Name     Serial Number      Op State  Availability   Runtime
Connectivity AP Model AP Type

54    AP-54       00:0c:e6:00:3e:a8  Disabled  Offline        3.1.4-25 None
AP320 Local
     AP Table(1 entry)
```

Customizing the CLI Prompt

Default CLI Prompt

By default, the CLI prompt consists of the system name followed by an angle bracket (>) for user EXEC mode or a pound sign (#) for privileged EXEC mode.

© 2012 Meru Networks, Inc.

Commands to Customize CLI Prompt

To customize the CLI prompt for your system, use one of the following commands in Global Configuration mode:

Table 2: Commands to Customize the CLI Prompt

Command	Purpose
prompt *string*	Customizes the CLI prompt.
no prompt	Disables the display of the CLI prompt.
default prompt	Sets the prompt to the default, which is the hostname.

Manipulating Terminal Characteristics

Displaying Terminal Settings

To display the current terminal settings, including the screen length and width, type:

```
controller> show terminal
Terminal Length:         0
Terminal Width:          80
History Buffer Size:     10
```

Setting Terminal Screen Length and Width

By default, the terminal length is set to 0 rows, and the width is set to 80 columns. To override this default setting, and set the number of lines or character columns on the current terminal screen for the current session, use the following commands in user EXEC mode:

```
controller> terminal length screen-length
controller> terminal width characters
```

To reset the terminal length and width to the default values, use the default command:

```
controller> default terminal length
controller> default terminal width
```

 © 2012 Meru Networks, Inc.

Setting the terminal length to a non-zero value turns on paging. When the output length exceeds the terminal length, the output is paused and a `---More---` is displayed:

1. If the space bar is pressed at the `---More---` prompt, another page of output is displayed.
2. If the ENTER key is pressed at the `---More---` prompt, a single line of output is displayed.
3. If any other character at the `---More---` prompt, this signifies the end of output and the command prompt is displayed.

Ending a Session

To end a session, use the following command in either User or privileged EXEC mode:

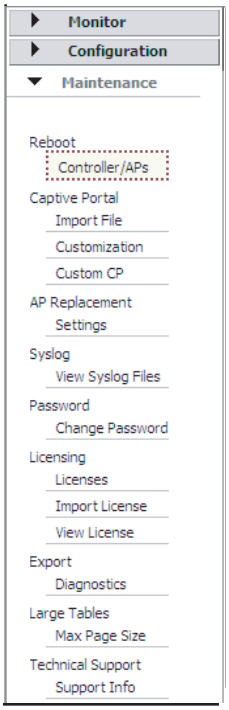
```
controller> exit
```

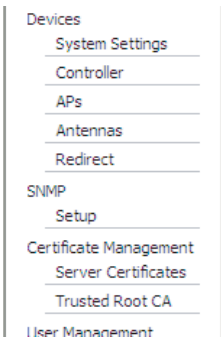
 © 2012 Meru Networks, Inc.

Chapter 2
System Director Web UI Concepts

Access System Director by entering the IP address of the controller in a browser (see **Browsers** below). The Web UI interface that displays operates from three menus.

Configuration Monitor Maintenance





How Does the GUI Relate to CLI Commands?

Most System Director tasks can be accomplished using either the CLI or the GUI. Some commands can only be done with one or the other. The chart below gives some examples of this. You can refer to the illustration on the previous page or click the indicated links on the UI Interface.

I need to know...	With the CLI	With the GUI
Stations that are associated	**show station** **show phones**	Station table (**Monitor** > **Devices** > **All Stations**)
Stations and APs that are detectable	**show ap-discovered**	Station table (**Monitor** > **Devices** > **All Stations**)
Controller setup	**show controller**	System Summary (**Monitor > Dashboard > System**)
APs that are connected	**show ap**	Station table (click **Monitor** > **Devices** > **All Stations**)
How are APs connected	**show ap-connectivity** *ap-id*	Station table (click **Monitor** > **Devices** > **All Stations**)
How many stations are connected	**sh station** or **sh topostation**	Station table (**Monitor** > **Devices** > **All Stations**)
Stations connections to certain AP	**show ap-assigned** *mac-address*	Station table (**Monitor** > **Devices** > **All Stations**)
Add a new operating system version to a controller using FTP	**copy ftp://***ftpuser*:*ftp-passwd*@*offbox-ip-address*/**meru-5.1-*xxx*-*MODEL*-rpm.tar.** **upgrade system 5.1**	NA
See aggregate throughput for all APs	NA	System Dashboard (**Monitor** > **Dashboard** > **System**)
Syslog message summary	**show syslog-table** shows the entire log	SysLog Files Table (**Monitor > Syslog > View Syslog Files**) shows a segment of the log based on time
Alarms	**show alarms**	Alarm Dashboard (**Monitor** > **Dashboard** > **Alarms**)
Rogues detected	**show rogue-ap-list**	Rogue AP Table (**Monitor > Wireless IDS/IPS > Rogue AP Table**)
AP300/AP400 model (AP320, etc.)	**show ap**	

 © 2012 Meru Networks, Inc.

I need to know...	With the CLI	With the GUI
Throughput bottlenecks	**sh statistics top10 -ap -problem** (shows loss %) **analyze-capture start**, **analyze-capture stop**, **analyze-capture capture**	System Dashboard (**Monitor** > **Dashboard** > **System**)
High-volume users	**sh statistics top10-station-talker**	Stations Dashboard (click **Monitor > Dashboard > Station)**
Why a user's connection failed	**station-log/station add** **analyze-capture**	Station Diagnostics (click **Monitor > Diagnostics > Station**)
Dead spots	**sh topoap**	Station Diagnostics (**Monitor > Diagnostics > Station >** Signal Strength Chart)
Station retries	**sh station**	**Monitor > Dashboard > Station >** Retries chart
User's location	**sh station** or **sh topostation**	NA
Overloaded radios	**sh station** **sh statistics top10-ap-problem**	**Monitor > Dashboard > Radio >** Retries chart Radio Dashboard (**Monitor > Dashboard > Radio >** Throughput Chart)

© 2012 Meru Networks, Inc.

Browsers

System Director supports these browsers:

- Internet Explorer versions 6, 7, and 8 on both Windows XP and Vista
- Firefox on Windows XP
- Safari on MAC OS

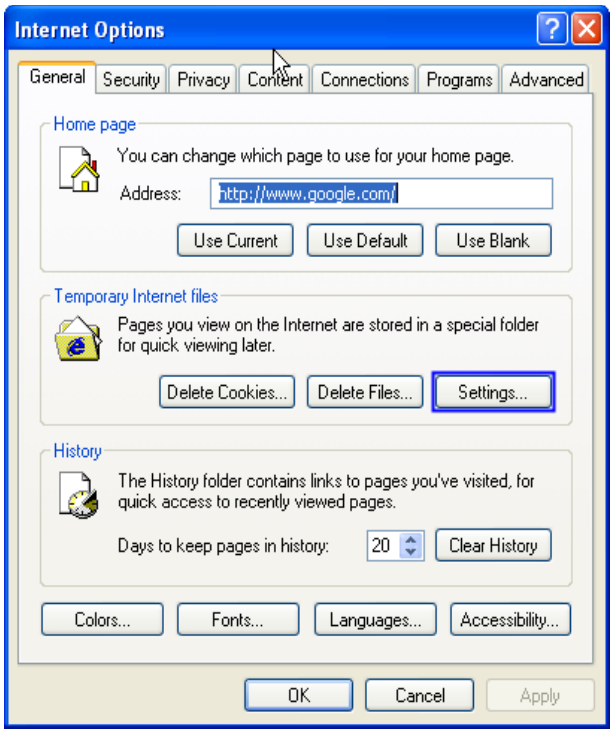
Opera and Chrome are not supported.

Internet Explorer Caching Settings

Be sure to turn off caching on any computer using Internet Explorer version 6 or 7, because dashboard updates are frequently ignored with caching on. To configure Windows Internet Explorer, follow these steps:

1. Access Internet Options by opening an Internet Explorer window and then clicking **Tools > Internet Options**.
   A window like this one displays:

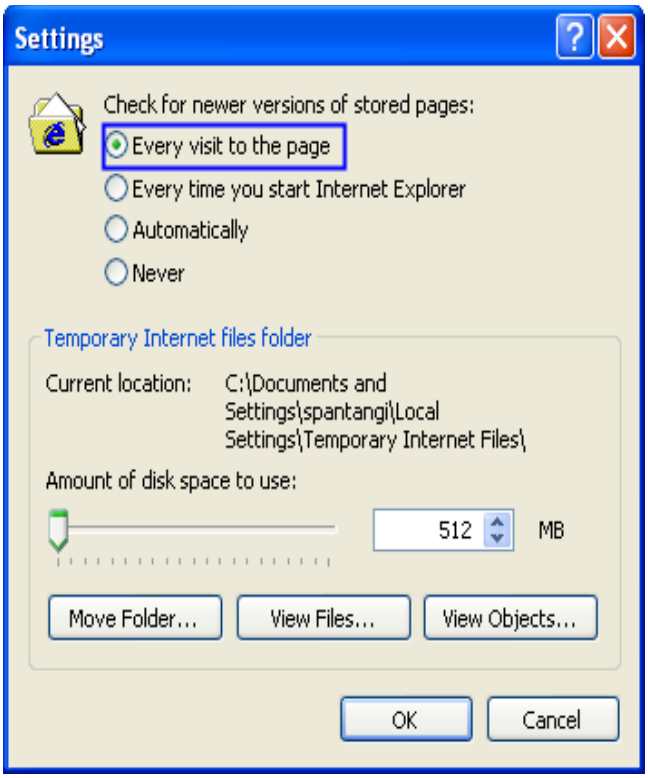
Figure 1: Internet Options for Microsoft Windows



2. Under Browsing history, click **Settings**.
   A window like this one displays:

 © 2012 Meru Networks, Inc.

Figure 2: Internet Browsing Settings



3. Select the option **Every time I visit the web page**.
4. Click **OK**.

The dashboard will now be updated every time the statistics change.

Note that no configuration is needed for Mozilla Firefox.

What is E(z)RF Network Manager?

E(z)RF Network Manager is a Meru product that manages multiple controllers. ESS, Security, VLAN, GRE and Radius profiles can all be configured either from E(z)RF Network Manager or from the controller. You can tell where a profile was configured by checking the read-only field Owner; the Owner is either **E(z)RF NMS** or **controller**. If a profile belongs to E(z)RF Network Manager, you cannot alter or delete it from a controller.

If a profile belongs to E(z)RF Network Manager, the recommendation is to alter/delete it from the Network Manager interface. If for some reason Network Manager is not reachable from the controller, then the recommendation is to unregister the Network Manager server from the controller using the **nms-server unregister** CLI command.

 © 2012 Meru Networks, Inc.

Chapter 3
Managing System Files

This chapter describes how to work with the Controller File System (CFS), which provides a single interface for managing all files available for use with Meru controllers. This chapter contains the following sections:

- **About the CFS**
- **Working with Configuration Files**
- **Manipulating System Files**
- **Upgrading System Images**
- **Summary of File System Commands**

About the CFS

The CFS allows you to manage the controller operating system (System Director) and its configuration files.

Files used to operate the controller are located in directories on the controller flash card. Initially, the flash contains the shipped operating system, referred to as the image, which of course is set with default settings. During the course of normal operation, you probably will want to perform some or all of the following tasks:

- Configure custom settings and save the settings to a configuration file.
- Save the configuration file to a backup directory on the controller.
- Save the configuration file to a remote location to provide a more secure backup or as input for configuring other controllers.
- Restore the settings from a known, reliable backup file.
- Restore the system to its default settings.
- Upgrade the system to a new version of the operating system.
- Downgrade the system to a previous operating system version.
- Execute scripts to automate configuration.

© 2012 Meru Networks, Inc.

To accomplish these tasks you need to use the CFS to manipulate files. The CFS allows you to perform the following tasks:

- Display information about files within a directory
  The display information includes the file name, size, and date of modification.
- Navigate to different directories
  You can navigate to different directories and list the files in a directory.
- Copy files
  The CFS allows you to copy files on the controller via a pathname or to manipulate remote files. Use Uniform Resource Locators (URLs) to specify the location of a remote file. URLs are commonly used to specify files or locations on the World Wide Web. You can use the URL format to copy file to or retrieve files from a location on a remote file server.
- Delete files

Working with Local Directories

The controller flash card uses the following directories to organize its system files. You can access the following local directories:

Directory Name	Directory Contents
images	Directory where the current image resides and where you can place upgrade images that you have obtained remotely.
backup	Directory containing backup configuration files and databases.
ATS/scripts	Directory containing AP bootup scripts.
capture	Directory containing the packet capture files.

Viewing Directory and File Information

Use the **pwd** command to view the current directory. By default, the current working directory is images, as shown with the **pwd** command:

```
controller# pwd
images
```

To view a detailed listing about the contents of a directory, use the **dir** command, which accepts an optional directory or filename argument:

dir [[*directory/*]*filename*]

 © 2012 Meru Networks, Inc.

For example, to display the contents of the images directory:

```
controller# dir
total 10
total 70
drwxr-xr-x    8 root     root         1024 Jan 30 11:00 meru-3.6-45
drwxrwxr-x    8 522      522          1024 Feb 21  2008 meru-3.6-46
-rw-r--r--    1 root     root         2233 Feb 19 02:07
   meru.user-diagnostics.Dickens.2008-02-19.02-07-17.tar.gz
-rw-r--r--    1 root     root         3195 Feb 19 02:17
   meru.user-diagnostics.Dickens.2008-02-19.02-17-17.tar.gz
-rw-r--r--    1 root     root         3064 Feb 21 00:50
   meru.user-diagnostics.Dickens.2008-02-21.00-50-50.tar.gz
lrwxrwxrwx    1 root     root           28 Feb 21 00:50 mibs.tar.gz ->
   meru-3.6-46/mibs/mibs.tar.gz
-rw-r--r--    1 root     root        16778 Feb 21 00:50 pre-upgrade-config
-rw-r--r--    1 root     root        18549 Feb 21 00:53 script.log
-rw-r--r--    1 root     root        16427 Feb 21 00:53 startup-config
-rw-------    1 root     root         1915 Feb 21 00:50 upgrade.log
```

To view information about a file in different directory, use the directory arguments:

```
controller# dir ATS/scripts

total 4
-rwxr-xr-x    1 root     root           67 Feb 21  2008 dense-voice.scr
-rwxr-xr-x    1 root     root           25 Feb 21  2008 guard.scr
-rwxr-xr-x    1 root     root           82 Feb 21  2008 non-guard.scr
-rwxr-xr-x    1 root     root          126 Feb 21  2008 svp.scr
```

Changing to Another Directory

Use the **cd** command to navigate to another directory on the controller:

```
controller# cd backup
```

Use the **pwd** command to view the name of the current directory:

```
controller# pwd
backup
```

© 2012 Meru Networks, Inc.

Working with Configuration Files

Configuration files direct the functions of the controller. Commands in the configuration file are parsed by the CLI and executed when the system is booted from the database, or when you enter commands at the CLI in a configuration mode. There are two types of configuration files used by the CLI:

- The startup database file (`startup-config`) is executed at system startup.
- The running configuration file (`running-config`) contains the current (running) configuration of the software.

The startup configuration file may be different from the running configuration file. For example, you might want to change the configuration, and then for a time period evaluate your changes before saving them to the startup configuration.

In this case, you would make the configuration changes using the **configure terminal** commands, but not save the configuration. When you were sure you wanted to permanently incorporate the changes, you would use the **copy running-config startup-config** EXEC command.

Changing the Running Configuration

The **configure terminal** EXEC command allows you to make changes to the running configuration. Commands are executed immediately, but are not saved. To save the changes, see “Changing the Startup Configuration.”

Table 3: Steps to Modify the Running Configuration

Command	Purpose
`controller# configure terminal`	Enters global configuration mode.
`controller(config)# .....`	Enter the commands you want to put in your running configuration. The CLI executes these commands immediately and also inserts them to the running configuration file.
`controller# copy running-config startup-config`	Saves the running configuration file as the startup configuration file. You must save the running configuration to the startup configuration file for your configuration changes to persist during a reboot.

 © 2012 Meru Networks, Inc.

Table 3: Steps to Modify the Running Configuration

Command	Purpose

`controller(config)# end`
or
`controller(config)# Ctrl-Z`
	Ends the configuration session and exits EXEC mode. **NOTE**: You need to press the Ctrl and Z keys simultaneously.

`controller(config)# Ctrl-C`	Cancels any changes and reverts to the previous mode.

Changing the Startup Configuration

To make your configuration changes persistent across reboots, use the **copy running-config startup-config** EXEC command to copy the running configuration to a startup configuration.

Manipulating System Files

To manage the system files, you might want to transfer a configuration file to a remote system to back up the file, or obtain from a remote system an update or backup file. To access the remote system, you probably need a username and password. This section provides some example commands for performing these tasks.

Manipulating Files on a Network Server

To specify a file on a network server, use one of the following forms:

- **ftp://<***username***>:<***password***>@***server/filename*
- **scp://<***username***>:<***password***>@***server/filename*
- **sftp://<***username***>:<***password***>@***server/filename*
- **tftp://***server/filename*

The *server* can either be an IP address or host name. The username, if specified, overrides a username specified by the global configuration command **ip ftp username**. A *password* also overrides a password specified by the global configuration command **ip ftp password**.

The specified *directory* and *filename* are relative to the directory used for file transfers, or in absolute format.

© 2012 Meru Networks, Inc.

The following example uses secure FTP to access the file named `meru-3.7-config` on a server named ftp.merunetworks.com. This example uses the username **admin** and the password **secret** to access this server:

```
controller# copy sftp://admin:secret@ftp.merunetworks.com/meru-3.7-config<space>.
```

For SCP (secure copy), replace the prefix **sftp** with **scp**.

Remote File Transfer Tasks

On a remote file system located on an FTP, SFTP, TFTP or SSH server, you can perform the following tasks:

- Copy files to or from the controller using the **copy** command.
- List the files in a given directory using the **dir** command.

Copying Files to a Remote Server

For example, to copy a backup image `jun01.backup.mbu` from the local directory `images` to a remote directory `/home/backup` on server **server1**, with user **user1** using FTP, with the same remote filename, type:

```
controller# cd images
controller# dir
total 48
-rw-r--r-- 1 root root        15317 Jan  9 15:46 jun01.backup.mbu

controller# copy jun01.backup.mbu ftp://user1@server1/home/backup/.
FTP Password:
controller#
```

Type the password for user **user1** at the FTP Password prompt. To use SCP instead of FTP:

```
controller# copy jun01.backup.mbu scp://user1@server1/home/backup/.
SCP Password:
```

Displaying a Remote Server's Directory Contents

To display the contents of the remote directory `/home/backup` on the server **server1**, for the username **user1** and **password** userpass, you can type:

```
controller# dir ftp://user1:userpass@server1/home/backup
```

If you only specify the user name but not the password, the CLI prompts you to enter the password:

```
controller# dir ftp://user1@server1/home/backup
FTP Password:
```

 © 2012 Meru Networks, Inc.

Setting a Remote Username and Password

The secure remote file transfer commands require a remote username and password on each request to a server. The CLI uses the user name and password specified in the **dir** or **copy** command to authenticate with the remote file servers.

If you do not want to type the user name and password for each secure remote file transfer command, you can set these values for the duration of your session using the **ip ftp**, **ip sftp**, or **ip scp** commands.

For example, to set the FTP user name to **user1** and the FTP password to **userpass**, type:

```
controller# configure terminal
controller(config)# ip ftp username user1
controller(config)# ip ftp password userpass
controller(config)# ^Z
controller#
```

Likewise, to set the SCP user name to **user1** and the SCP password to **userpass**, type:

```
controller# configure terminal
controller(config)# ip scp username user1
controller(config)# ip scp password userpass
controller(config)# ^Z
controller#
```

If you have set the FTP username and password as in the previous example, you can now type the following:

```
controller# dir ftp://server1/home/backup
```

Upgrading System Images

The controller is shipped with a pre-installed system image, containing the complete System Director software. This image is loaded when the controller boots. As new software releases become available, you may decide to upgrade the system image.

Each release is accompanied by a Release Notes file on the documentation CD, which include procedures for upgrading different types of system configurations to the current release. Be sure to use the procedure included in the Release Notes when you choose to upgrade your system, as they provide the most up-to-date procedures.

© 2012 Meru Networks, Inc.

Summary of File System Commands

The following lists the available file system commands in privileged EXEC mode.

Command	Purpose
`controller> **cd** [*filesystem*]`	Sets the default directory on the Flash memory device. If no directory name is specified, this sets the default directory to images. Permitted directories are: • images: The directory containing upgrade images • ATS/scripts: The directory containing AP boot scripts • backup: The directory containing database backup images.
`controller> **pwd**`	Displays the current working directory.
`controller> **dir** [*filesystem*:][*filename*]`	Displays a list of files on a file system. This can be one of the permitted directories given in the cd command or a remote directory referenced by an FTP URL.

`controller# **delete** *filename*`
`controller# **delete** *directory:filename*`
`controller# **delete flash:** *image*`
	Deletes a file from the file system or deletes an upgrade image file from flash memory. The *directory* parameter can be used to delete a file from a different folder.

`controller# **show flash**`	Display the versions of the image files contained in the controller's flash memory.
`controller# **rename** *old new*`	Renames a file from *old* to *new*.
`controller# **show running-config**`	Display the contents of the running configuration file.
`controller# **more running-config**`	Display the contents of the running configuration file. Alias for **show running-config**, but in contrast to that command, this one prompts the user to press a key to scroll the screen once it is filled. This allows the configuration to be shown a screen at a time, instead of scrolling all the way through instantly.

© 2012 Meru Networks, Inc.

Command	Purpose

`controller# copy running-config ftp|sftp|scp:[[[//username:password]@location/directory]/filename]`	Copies the running configuration file to an FTP, SFTP, or SCP server, for example:
	`controller# copy running-config ftp://user1:userpass@server1/jan01-config`
	`controller# copy running-config scp://user1:userpass@server1/jan01-config`

`controller# copy running-config startup-config`	Saves the running-configuration to the startup configuration to make it persistent. You should always do this after a set of configuration commands if you want your changes to persist across reboots.
`controller# reload ap [id] | all | controller | default`	Reboots the controller and/or the specified AP: • If the **ap** keyword is specified, all APs are rebooted, or if *id* is included, the AP with the identifier *id* is rebooted. • If the keyword **all** is specified, the Meru controller and all the APs are rebooted, using the current startup configuration. • If the keyword **controller** is specified, the controller is rebooted, using the current startup configuration. • If the keyword **default** is specified, the controller and all the APs are rebooted at the factory default startup configuration.
`controller# upgrade feature version`	Upgrades the system with the specified feature.
`controller# upgrade system version`	Upgrades the system image on the controller and all APs to the specified version.

© 2012 Meru Networks, Inc.

Command	Purpose
`controller# **upgrade ap** *version* | **same** [*id* | *range* | **all**]`	Upgrades the access point image to the same version of system software that the controller is running. • *id*—Upgrades the access point with the specified ID to the same version of system software that the controller is running. • range—Upgrades a range of APs, specified as a list using commas and dashes, without spaces or wildcards. AP IDs must be listed in ascending order. • **all**—Upgrades all access point image to the same version of system software that the controller is running.
`controller# **downgrade system** *version*`	Downgrades the system image on the controller and all APs to the specified version. Note that when this command is executed, the user will be prompted to remove all local users and groups from the system.
`controller# **run** *script*`	Executes the named script. If the script is in the current directory, the relative path name is specified. Otherwise, the full path name must be specified. The script must be either in images, ATS/scripts, or backup.

Chapter 4
Managing the System

This chapter describes procedures for configuring controllers and managing the system. This chapter contains the following sections:

- Configure Basic Controller Parameters During Setup
- Configure Controller Parameters From the Web UI
- Configure Controller Parameters From the CLI
- System Licensing
- Configuring E(z)RF Location Manager
- 802.11n Video Service Module (ViSM)
- Using AeroScout
- Configure Controller Security
- Configure Controller Redundancy
- System Director Communication Ports

Configure Basic Controller Parameters During Setup

These basic controller parameters are configured by someone with Level 15 permission, using the interactive **setup** script that sets up every new controller:

- Country setting
- Controller location
- Hostname
- Passwords for admins and guests
- Dynamic IP address or a static IP address and netmask
- Time zone
- DNS server names
- Gateway server name
- Network Time Protocol server

© 2012 Meru Networks, Inc.

To start the setup script, at the Privileged EXEC prompt, type **setup**. Refer to the "Initial Setup" chapter of the *Meru System Director Getting Started Guide* for an example session using the **setup** command.

Configure Controller Parameters From the Web UI

To add a new controller, click **Configuration > Devices > Controller > Add.** To reconfigure an existing controller, click **Configuration > Devices > Controller >** select a controller **> Settings.** The following parameters can be configured from the Web UI with Level 10 permission:

- Information for recognizing and tracking controllers such as the Description, Location, and Contact person
- Whether or not APs should be Automatically Upgraded by a controller
- DHCP Server address and DHCP Relay Passthrough (whether or not packets are actually passed to the DHCP server)
- Statistics Polling Period and Audit Polling Period, which affect how often a controller refreshes data
- Default AP Initialization Script (bootscript) that run on APs with no other script specified
- Controller Index number used for identification (Note that changing this initiates a controller reboot.)
- Whether or not the controller will interact with the AeroScout Location Engine and associated APs will interact with AeroScout Tags to provide real-time asset tracking
- Whether or not Fastpath Mode is used. Fastpath Mode accelerates the rate that packets move through the Ethernet interface based on identification of an IP packet stream. When FastPath is enabled, the beginning of the IP packet stream is processed by the controller, and all subsequent packets of the same stream are forwarded according to the disposition of the initial packets, without being processed by the controller. This offloads a significant amount of processing from the controller.
- Bonding Mode affects only MC4100. Single Bonding combines all MC4100 Ethernet ports into one port for accelerated throughput. Dual Bonding configures two ports for this controller.
- Virtual Cell for AP300, AP400, or AP1000 is not determined by any controller setting. However, AP150 Virtual Cell is enabled or disabled at the controller.

 © 2012 Meru Networks, Inc.

- Whether or not Dynamic Frequency Selection (DFS) is enforced. For installations within the United States, enforcing DFS means that channels 52-64 (5.25-5.35 GHz), 100-116 (5.47-5.725 GHz), and 136-140 (5.68-5.70 GHz) conform to DFS regulations, protecting radar from interference on these channels.
- The number of minutes of station inactivity that causes a client to time out is set by the Station Aging Out Period.
- Whether or not inter-controller roaming will be used. Enabling the Roaming Domain sets IP-IP tunnel-based routing between a named group of controllers that is configured elsewhere. For more information, see the chapter on **Intercontroller Roaming**.

Configure UDP Broadcast with Web UI

You can enable all UDP ports at once with the CLI commands for upstream and downstream traffic. Meru does not recommend that you enable this feature on a production network because it could lead to broadcast storms leading to network outages. This feature is provided for testing purposes only.

You need to assign each ESS (see the chapter **Configuring an ESS**) to a specific VLAN (see the chapter **Configuring VLANs**) before enabling all UDP broadcast ports. Having multiple ESS's in the default VLAN and enabling all UDP broadcast ports does not work.

To configure UDP broadcast upstream/downstream for all ports, follow these steps:

1. Click **Configuration > Devices > System Settings**.
2. Click the tab **UDP Broadcast Up**.
3. Click **Add**, provide a UDP Port Number in the range 1-65355, and then click **OK**. The port number now appears in the Upstream UDP Broadcast Port list.
4. Click the tab **UDP Broadcast Down**.

Click **Add**, provide a UDP Port Number in the range 1-65355, and then click **OK**. The port number now appears in the Downstream UDP Broadcast Port list.

Configure Controller Parameters From the CLI

Reset System and System Passwords from the CLI

The passwords for the system users "admin' and "guest" can be reset to their default values during a system boot. When the controller prompts "accepting reset request" displays, type **pass** to reset the passwords.

To reset the settings for the entire system to their default values, type **reset** at the reset system values prompt.

© 2012 Meru Networks, Inc.

Limit Wireless Client Access to the Controller From the CLI

Administrators wishing to block access to the controller management utilities for wireless clients can do so with the **no management access** command. When wireless management access is blocked, all packets sent to the controller by wireless clients are dropped except for those used for Captive Portal.

To remove wireless access to the controller, enter the command:

```
controller(config)# no management wireless
```

To check the management status, use the **show controller** command. The line near the bottom of the output, Management by wireless stations: will show either an on or off value.

```
MC3000# show controller
Global Controller Parameters

Controller ID : 1
Description : InteropLab-MC1000
Host Name : InteropLab-MC1000
Uptime : 02d:13h:36m:19s
Location : DC Cabinet 6
Contact : Network Group
Operational State : Enabled
Availability Status : Online
Alarm State : No Alarm
Automatic AP Upgrade : off
Virtual IP Address : 172.26.96.11
Virtual Netmask : 255.255.255.0
Default Gateway : 172.26.96.1
DHCP Server : 10.0.0.10
Statistics Polling Period (seconds)/0 disable Polling : 60
Audit Polling Period (seconds)/0 disable Polling : 60
Software Version : 4.1-49
Network Device Id : 00:90:0b:0e:a8:61
System Id : 1FC4B274070D
Default AP Init Script :
DHCP Relay Passthrough : on
Controller Model : MC1000
Country Setting : United States Of America

Manufacturing Serial # : 2008MC10001039
Management by wireless stations : on
Controller Index : 0
Topology Information Update : off
AeroScout Enable/Disable : disable
FastPath Mode : on
Bonding Mode : single
AP150 Vcell : enable
```

Station Aging Out Period (minutes) : 2000To re-enable access to wireless clients, use the **management wireless** command:

```
controller(config)# management wireless
```

 © 2012 Meru Networks, Inc.

Limit Wired Client Access to the Controller With QoS Rules

To control access to the controller from wired network devices, you can configure rule-based IP ACL lists using the **qosrules** command. This section provides qosrule examples for several types of configurations.

The following is an example that blocks management access (on TCP and UDP) to the controller (at 192.168.1.2) for all devices except the host at 192.168.1.7. Notice that match tags are enabled when srcip, dstip, srcport, dstport, netprotocol, or packet min-length is configured for a rule.

Allow the host 192.168.1.7 to access the controller with TCP/UDP:

```
controller(config)#  qosrule 20 netprotocol 6 qosprotocol none
controller(config-qosrule)# netprotocol-match
controller(config-qosrule)# srcip 192.168.1.7
controller(config-qosrule)# srcip-match
controller(config-qosrule)# srcmask 255.255.255.255
controller(config-qosrule)# dstip 192.168.1.2
controller(config-qosrule)# dstip-match
controller(config-qosrule)# dstmask 255.255.255.255
controller(config-qosrule)# action forward
controller(config-qosrule)# end
controller(config)# qosrule 21 netprotocol 17 qosprotocol none
controller(config-qosrule)# netprotocol-match
controller(config-qosrule)# srcip 192.168.1.7
controller(config-qosrule)# srcip-match
controller(config-qosrule)# srcmask 255.255.255.255
controller(config-qosrule)# dstip 192.168.1.2
controller(config-qosrule)# dstip-match
controller(config-qosrule)# dstmask 255.255.255.255
controller(config-qosrule)# action forward
controller(config-qosrule)# end
```

The following qosrules allow wireless clients to access the controller on TCP ports 8080/8081 if using the Captive Portal feature.

```
controller(config)# qosrule 22 netprotocol 6 qosprotocol none
controller(config-qosrule)# netprotocol-match
controller(config-qosrule)# srcip <subnet of wireless clients>
controller(config-qosrule)# srcip-match
controller(config-qosrule)# srcmask <netmask of wireless clients>
controller(config-qosrule)# dstport-match on
controller(config-qosrule)# dstip 192.168.1.2
controller(config-qosrule)# dstip-match
controller(config-qosrule)# dstmask 255.255.255.255
controller(config-qosrule)# dstport 8080
controller(config-qosrule)# action forward
controller(config-qosrule)# end

controller(config)# qosrule 23 netprotocol 6 qosprotocol none
controller(config-qosrule)# netprotocol-match
controller(config-qosrule)# srcip <subnet of wireless clients>
controller(config-qosrule)# srcmask <netmask of wireless clients>
controller(config-qosrule)# dstport-match on
```

© 2012 Meru Networks, Inc.

```
controller(config-qosrule)# dstip 192.168.1.2
controller(config-qosrule)# dstip-match
controller(config-qosrule)# dstmask 255.255.255.255
controller(config-qosrule)# dstport 8081
controller(config-qosrule)# action forward
controller(config-qosrule)# end
```

The following qosrules block all hosts from accessing the Controller using TCP/UDP.

```
controller(config)# qosrule 24 netprotocol 6 qosprotocol none
controller(config-qosrule)# netprotocol-match
controller(config-qosrule)# dstip 192.168.1.2
controller(config-qosrule)# dstip-match
controller(config-qosrule)# dstmask 255.255.255.255
controller(config-qosrule)# action drop
controller(config-qosrule)# end

controller(config)# qosrule 25 netprotocol 17 qosprotocol none
controller(config-qosrule)# dstip 192.168.1.2
controller(config-qosrule)# dstip-match
controller(config-qosrule)# dstmask 255.255.255.255
controller(config-qosrule)# action drop
controller(config-qosrule)# end
```

Configuring UDP Broadcast From the CLI

You can enable all UDP ports at once with the CLI commands for upstream and downstream traffic. Meru does not recommend that you enable this feature on a production network because it could lead to broadcast storms leading to network outages. This feature is provided for testing purposes only.

You need to assign each ESS (see the chapter **Configuring an ESS**) to a specific VLAN (see the chapter **Configuring VLANs**) before enabling all UDP broadcast ports. Having multiple ESS's in the default VLAN and enabling all UDP broadcast ports does not work.

To configure UDP broadcast upstream/downstream for all ports, use these two CLI commands:

```
default# configure terminal
default(config)# ip udp-broadcast upstream all-ports selected
default(config)# ip udp-broadcast downstream all-ports on
default(config)# end
```

To display configured UDP broadcast upstream/downstream for all ports, use these two CLI commands:

```
default# show ip udp-broadcast upstream all-ports
Upstream UDP Broadcast All Ports
UDP All Ports : on
default#
default# show ip udp-broadcast downstream all-ports
Downstream UDP Broadcast All Ports
UDP All Ports : selected
default#
```

 © 2012 Meru Networks, Inc.

Configure Time Services From the CLI

We recommend that you configure controllers to synchronize their system clock with a Network Time Protocol (NTP) server. This ensures the system time is accurate and standardized with other systems. Accurate and standardized system time is important for alarms, traces, syslog, and applications such as cryptography that use timestamps as a parameter for key management and lifetime control. An accurate clock is also necessary for intrusion detection, isolation and logging, as well as network monitoring, measurement, and control.

During the initial system configuration, the **setup** script prompts for an IP address of an NTP server. If you do not supply an IP address of an NTP server at that time, or if you wish to change an assigned server at a later time, you can use the **ntp server** followed by the **ntp sync** commands.

- To set up automatic periodic synchronizing with the configured NTP server, use the command **start-ntp**.

There are several NTP servers that can be designated as the time server. The site `www.ntp.org` provides a list of servers that can be used.

To set a server as an NTP server, use the command:

ntp server *ip-address*

where *ip-address* is the IP address of the NTP server providing clock synchronization.

Note: If you choose not to use a NTP server to synchronize the system clock, the system time can be set manually with the **calendar set** command.

Configure a Controller Index with the CLI

To configure a controller index from CLI, using the following commands

```
ramecntrl(0)# configure terminal
ramecntrl(0)(config)# controller-index 22
ramecntrl(0)(config)# exit
```

Note that changing the index causes a controller to reboot.

System Licensing

Licensing is embedded in controller firmware and is enabled with a Meru-generated license file tied to that specific controller. Obtain these licensing files from **www.merunetworks.com/license.**

© 2012 Meru Networks, Inc.

Configure a License with the Web UI

To see your license from the CLI, use the following commands:

```
controller# show controller
controller# show license
controller# show license-file active
```

You need a license for any of the following optional features if you plan to enable them with release 5.1:

- More than five A/B/G APs
- N-capable AP300s
- N+1 (for more than two controllers)
- Per-User Firewall
- GRE Tunnel
- Dual ABG
- Mesh/Wireless

Configure a License with the Web UI

To see your license from the GUI, click **Maintenance > Licensing > View License**. To import a license using the GUI, click **Maintenance > Licensing > Import License** and follow the directions. To see existing licenses, click **Maintenance > Licensing > View License**.

The following CLI command imports the license file license17331.lic from the FTP server at 192.168.1.10 to an active MC3000 controller:

```
controller# configure terminal
controller(config)# license
   ftp://admin:admin@192.168.1.10/license17331.lic active
controller(config)# end
```

Use the **show license** command to see the status of the system licenses:

```
Feature Name        CtlrStatus  LicenseType Expiry Date   TotalCount
   InUse

controller         active     permanent   -           1         1

AP300 Licensing Changed in Release 4.0 and Later

Before release 4.0, all AP300 units were recognized as AP320, N-capable APs. Because AP300 licensing has been applied in System Director release 4.0, now AP320, AP310, AP302, AP301, AP311, and AP320i are individually recognized and require the appropriate licenses to be N-capable. This could affect upgraded AP300 units because licenses are required for specific radios. You will have to either reconfigure units such as AP302, AP311 or AP301 in such a way that total number of interfaces configured as 11n in all APs connected to the controller exactly match the number of 11n license on the controller or alternately obtain more licenses that will allow you to configure more interfaces to 11n. To obtain additional licenses, **www.merunetworks.com/license**. To reconfigure an AP300, see the directions in any version of release notes later than 4.0.

Configuring E(z)RF Location Manager

Location Manager is supported by release 3.7 and later.

Configure E(z)RF Location Manager with the CLI

This example creates a packet-capture-profile named Location on a controller and then forwards the captured packets directly from AP 16 to Location Manager on port #9177. Port 9177 is the port where Location Manager is listening for incoming packets in L3 mode.

```
MC3K-1#
MC3K-1# configure terminal
MC3K-1(config)# packet-capture-profile Location
MC3K-1(config-pcap)# mode l3 destination-ip 1.1.1.1 port 9177
MC3K-1(config-pcap)# ap-list 16
MC3K-1(config-pcap)# exit
MC3K-1(config)# exit
MC3K-1# show packet-capture-profile Location
AP Packet Capture profiles

Packet Capture Profile Name           : Location
Packet Capture profile Enable/Disable   : off
Modes Allowed L2/L3                     : l3
Destination IP Address                  : 1.1.1.1
UDP Destination Port                    : 9177
Destination MAC for L2 mode             : 00:00:00:00:00:00
Rx only/Tx only/Both                    : rx
Rate Limiting per station or cumulative : station
Token Bucket Rate                       : 10
Token Bucket Size                       : 10
AP Selection                            : 16

Rate Limiting                              : off
Capture frames sent by other APs in the network : on
MC3K-1#
```

For a detailed explanation of the packet capture profile commands, see the Troubleshooting chapter of the *Meru System Director Configuration Guide*.

802.11n Video Service Module (ViSM)

Video streaming has the low latency and loss requirements of voice with the high-throughput requirements of data. The Meru Networks Video Service Module™ (ViSM) is an optional licensed software module that delivers predictable 802.11 video performance with minimal delay, latency and jitter. Sustainable high data rates, even in mixed traffic, are supported along with synchronization of video and audio transmissions.

ViSM also introduces additional mechanisms for optimizing unicast and multicast video such as application aware scheduling, voice/video synchronization, and client-specific multicast group management. Features include the following:

- High throughput with low burstiness offers predictable performance and consistent user experience
- Application-aware prioritization synchronizes the voice and video components of a video stream, adapting the delivery of each frame based on its importance to the application.
- Multicast group management optimizes delivery to only those Virtual Ports whose clients are members of the multicast group.
- Seamless video-optimized handoff proactively reroutes the multicast delivery tree to prevent lost video frames during a transition between access points and ensures zero loss for mobile video.
- User and role based policy enforcement provides granular control over application behavior.
- Visualization reveals which clients are running which applications.

Implementing ViSM

Virtual Port already changes multicast to unicast transmissions. ViSM adds per-client IGMP Snooping to the transmission. Therefore, to implement ViSM, turn on IGMP Snooping. CLI commands control IGMP snooping (see *Meru System Director Command Reference*). At this time, ViSM licensing is not enforced.

 © 2012 Meru Networks, Inc.

Using AeroScout

The AeroScout System version 3 (but not version 2) product works with Meru controllers and AP300 (in Virtual Cell or non-Virtual Cell mode) and AP150 (in non-Virtual Cell mode **only**) to locate and track tagged assets to deliver direct benefits such as process automation and theft prevention. Tags are small, battery-powered devices attached to equipment or personnel. See AeroScout's web site for more detailed information about the various tags available from AeroScout.

AeroScout tags do not associate to an access point; instead they send out beacon signals in pre-configurable intervals or when an event is triggered (the tag is in motion, a button is pressed, etc.). Messages transmitted by AeroScout tags are received by access points and are forwarded with additional information, such as RSSI values or signal strength measurements, to the AeroScout Engine. The Engine calculates the accurate location of the tag.

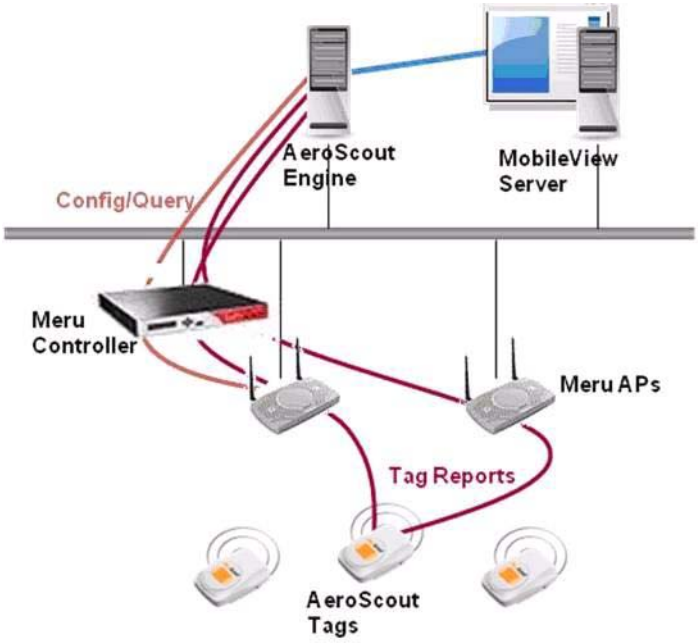
Reporting Tags do not affect the normal operation of access points; they keep performing in all of the supported modes (802.11a/b/g communication). AeroScout Tags also do not have an IP address and are unidirectional in the sense that they transmit and do not receive standard Wi-Fi messages.

For APs to process the tag signals and communicate with the AeroScout Engine, the AeroScout Engine-AP Interface protocol must be implemented on access points. In **Figure 3**, the AeroScout solution architecture is shown. The following is the high-level process that occurs in the implementation:

- AeroScout tags send short wireless messages at a regular interval.
- The signal is received by access points that are connected to a Meru controller running AeroScout software, and the signal is sent to the AeroScout engine along with its measured signal strength.
- The AeroScout engine uses signal strength to determine the coordinates of the reported location, and sends this data to AeroScout MobileView.
- AeroScout MobileView uses location data to display maps, enable searches, create alerts, manage assets, interface to third parties through an API.

© 2012 Meru Networks, Inc.

Figure 3: Figure 1 – AeroScout Network Diagram



In addition to Meru standard Wi-Fi infrastructure, AeroScout Location Receivers and Exciters can be deployed for time-different of arrival (TDOA) locationing and choke points respectively.

Configuring AeroScout

Tracking tags is done from the AeroScout product using a Meru controller and APs. To configure a Meru controller to work with AeroScout, use the command **aeroscout enable** as shown here:

```
controller(config)# aeroscout ?
<option>               Enable/Disable AeroScout Feature.
     disable          Disable
     enable           Enable
controller(config)#
```

Location Accuracy

Since RSSI values are the basis of the location calculation, the access point must match its channel with the tag's transmission channel, and drop tag messages that were transmitted on a channel other than that of the access point. The matching is implemented because tag reports contain the transmission channel in each message.

 © 2012 Meru Networks, Inc.

For this reason, the combination of AeroScout's solution architecture with Meru's Virtual Cell deployments and Air Traffic Control™ technology provide a more accurate location for tags. In other words, Meru's APs can all be deployed in a single channel with a virtualized BSSID, thereby providing more reference points for the tag messages and a more accurate location.

For the location of a tag to be calculated accurately, at least three access points need to report the Wi-Fi message transmitted by the tag. A message received and reported by less than three APs provides only a very general location which, in most cases, is the location of the AP closest to the tag. To see the tag locations, use AeroScout. Tags do not show up when you use the Meru CLI command **show discovered-station** or anywhere else from the Meru CLI.

It is important to place APs closer to the perimeter of the space that will tag and track assets, filling in coverage holes in the center of the coverage area. It is better to surround the tracking area. Aside from this, use standard Meru Networks deployment guidelines in placing the APs and distancing them from one another. In other words, plan for coverage and optimal data rates. When AeroScout Exciters are used for choke-point location, one AP receiving the Tag message is enough to deliver an accurate location report.

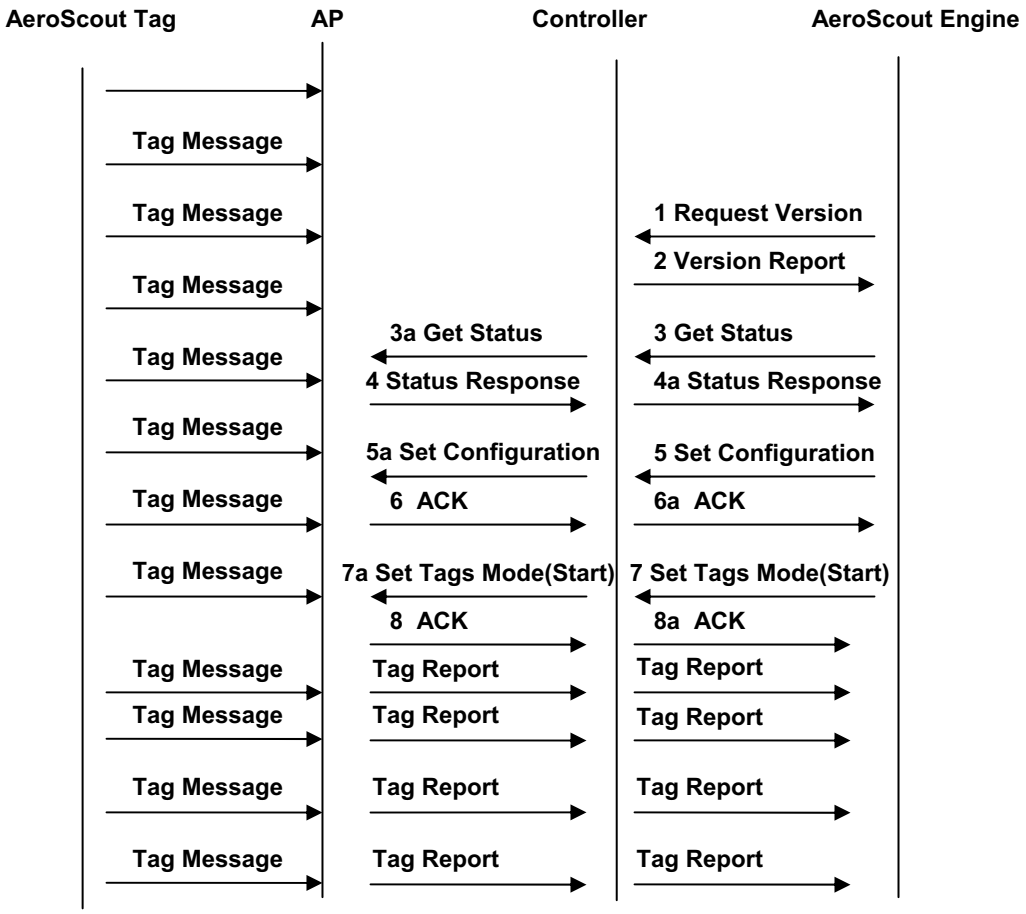
Tag Protocol Implementation

The Tag protocol operates between access points and the AeroScout engine. The Meru AeroScout implementation supports tag (but not laptop) messages transmitted in either in IBSS (default) or WDS frame format, although Meru APs receive and process tag frames only in IBSS format.

Once the Meru controller and access points are upgraded to the current version, the tag protocol is enabled automatically. No additional configuration steps are necessary. Management of the AeroScout Tags, Engine, and MobileView application are managed through the AeroScout platform. **Figure 4** shows the operation and messages used in the Tag protocol:

© 2012 Meru Networks, Inc.

Figure 4: AeroScout Tag Protocol Messages



AeroScout and Rogue Detection

If an AP interface is in dedicated scanning mode with Rogue AP enabled, tags are not forwarded for any channels. If an AP interface is in normal mode with Rogue AP enabled, tags are forwarded on the home channel only. Tags on foreign channels are not forwarded.

 © 2012 Meru Networks, Inc.

AeroScout Syslog Error Messages

Error Condition	Severity	Message
Cannot create a ATS AeroScout Manager mailbox	critical	AeroScoutMgr mailbox creation failed
Cannot set AeroScout mode in the driver	critical	Cannot set AeroScout mode to enable/disable
Invalid AE messages	warning	Unknown Message Code[0xXX]
		Data length error. rcvdLength[%d], expect at least [%d]
Messages from unknown or unsupported mailboxes	miscellaneous	Msg from Unknown MailboxId[xx]
Cannot allocate a mailbox buffer to send a controller message	warning	AllocBuf failed reqID[0xXXXX]
IOCTL to the AeroScout kernel module failed	warning	reqID[0xXXXX] IOCTL[xx] to AeroScout kernel module failed
Cannot get wireless channel config information	warning	Could not get wireless interface config for interface[xx]

AeroScout Mobile Unit

AeroScout offers Wi-Fi-based solutions for Real Time Location Service (RTLS). The following devices support AeroScout tag based location management:

- AP400
- AP300
- AP200
- AP150

Meru System Director supports the AeroScout Mobile Unit (Laptops, VOIP Phones) or Compounded Reporting and Generic AP Notification support only on the AP300.

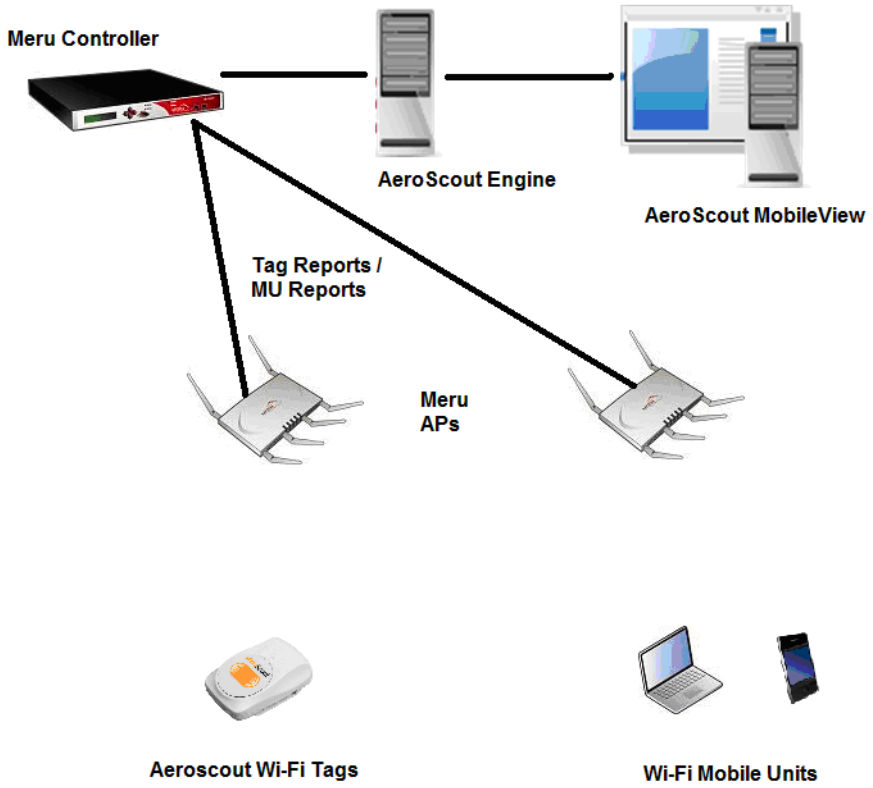
The AeroScout Mobile Unit architecture is displayed in **Figure 5**. The following is the high-level process that occurs in the implementation:

- Wi-Fi mobile units send wireless frames to one or more APs.
- The AP sends reports for each Wi-Fi mobile unit (by using a dilution mechanism to control traffic between AP and Engine) to the AeroScout Engine.

© 2012 Meru Networks, Inc.

- The AeroScout Engine determines the coordinates and sends it to AeroScout MobileView.
- The AeroScout Mobile View uses location data to display maps, enable searches, create alerts, manage assets, work with third-parties, and much more.

Figure 5: Aeroscout Mobile Unit



Wi-Fi Mobile Units (MUs) can be located, if associated to some access point, or while transmitting broadcast messages. The messages transmitted by **Wi-Fi Mobile Units** are received by Access Points and are passed along with additional information (e.g., signal strength measurements) to the **AeroScout Engine,** which is a core component of the AeroScout visibility system. The **AeroScout Engine** also calculates an accurate location of the Wi-Fi device. In order to locate the Mobile Units, Access Points that receive their messages must pass the **RSSI values** of each message to the **AeroScout Engine**. The access points must also be able to collect data messages from MUs that are not associated with them and pass the RSSI values to the AeroScout Engine.

Reporting Tags and/or Wi-Fi mobile units must not affect the normal operation of the AP—that is, the AP must be performing in all its supported modes, such as normal 802.11a/b/g communication, monitoring, bridge modes, etc. Due to the high MU traffic, it is possible to dilute the MU messages that are sent to AeroScout Engine.

 © 2012 Meru Networks, Inc.

Configuring AeroScout

Tracking tags is preformed from the AeroScout product using a Meru controller and APs. To configure a Meru controller to work with AeroScout, use the command **aeroscout enable**, as shown below:

```
default# sh aeroscout

Aeroscout Parameters

Enable/Disable              : enable

Aeroscout Engine IP Address : 0.0.0.0

Aeroscout Engine Port       : 12092

default#
```

Configure AeroScout Mobile Unit from AeroScout Engine

Follow the steps below to configure an AeroScout Mobile Unit from the AeroScout Engine:

1. Enable Aeroscout on the controller.
2. Open the Aeroscout Engine.
3. Load the Floor Map on the Engine.
4. Add the APs on the Aeroscout Engine.
5. In the **Configuration->system parameters->Access Points,** check the **"Enable mobile-unit location with access Points"** checkbox.
6. To start the Mobile Unit Positioning option on the AeroScout engine, select '**Start MU positioning'** from the Actions menu.

AeroScout Compounded Report

For better performance, several MU reports can be combined within a fixed pre-defined period in Compounded Reports. Meru's system combines a maximum of 18 MU reports in one Compounded Report. The number of Mobile Unit reports inside the Compounded Report varies as per the Compounded Message Timeout configured on the Aeroscout Integration Tool. The **'Compounded Message timeout'** is configured on the Aeroscout Integration tool under **'Set Configuration'.**

Dilution Timeout

In certain scenarios, the Mobile Unit traffic may be high, and the time resolution needed for location is much lower than the data rate of most Mobile Units. If every AP starts reporting every Wi-Fi frame to the Aeroscout Engine, it will create unnecessary data overhead on the network, and provide a real-time location in a level much higher than required.

To help the AP dilute messages from each Mobile Unit, the Aeroscout protocol provides the following two parameters:

© 2012 Meru Networks, Inc.

1. Dilution Factor
2. Dilution Timeout

Meru Mobile Unit reporting supports and implements only Dilution Timeout. The Dilution Timeout allows to set a limitation for the amount of time with no Mobile Unit messages from a specific Mobile Unit.

For Example: If the Dilution Timeout value is set to 60 seconds and, if the AP receives a message from an MU for which it has not reported a message to the AE for more than 60 seconds, the new message will be reported to the AE immediately regardless of the dilution factor and the dilution counter will be initialized. Commands broadcast by an MU (e.g. Probe Requests) are required to be forwarded to the AE regardless of the dilution parameters.

The Dilution Timeout can be configured on the Aeroscout Engine as follows **Configuration->system parameters->Access Points->Dilution Time out**.

Generic AP Notification

Generic AP notifications are autonomous messages sent to the Aeroscout Integration tool on port 12092 to report the AP connectivity state (AP comes online, offline, Aersocout parameter configuration changes).The Aeroscout Integration tool acknowledges all Generic AP notification messages sent by the controller. For Generic AP Notifications, the IP address of the Aeroscout engine must be configured on the controller.

Note:

- When AeroScout mode is changed from **"enabled" to "disabled",** No Generic AP notification is sent.
- Ensure to use the AP Integration tool with version as 1.0.1.

In the Meru solution, Generic AP notifications are sent out from the controller to the Aeroscout Engine during the AP connectivity state change or when aeroscout configurations on the controller undergoes a change. In general a Generic AP notification is used to communicate an IP address change, a "wake up" from reboot, and or any error conditions that need to be communicated to the Aeroscout engine.

Configure AeroScout Integration tool for Receiving the Generic AP Notification

To Configure AeroScout Integration tool for receiving the Generic AP Notification, perform the following steps:

- Enable AeroScout on the controller and configure the ip-address of the AeroScout Integration tool on controller.
- Open the AeroScout Integration Tool and configure the port from the default value 1122' to '12092'.

 © 2012 Meru Networks, Inc.

- In the scenario where the AP's come online and go offline, change the AeroScout Configuration parameter on the controller. The Controller sends a generic AP Notification for all the AP's on the Controller and the AeroScout Integration Tool acknowledges to the controller's notification for each generic AP Notification.

Configure Controller Security

See the chapter **Configuring Security** in this guide.

Configure Controller Redundancy

See the chapter **Implementing Redundancy** in this guide.

System Director Communication Ports

The tunnel between an AP and a controller uses the following ports for communication.

Traffic	Port
AeroScout	UDP/6091
Captive Portal (http redirection)	TCP/8080
Captive Portal (https redirection)	TCP/8081
E(z)RF Location Manager - Web UI	TCP/443
E(z)RF Location Manager - Administrative Web UI (SSL)	TCP/8003
E(z)RF Location Manager - AP Communication (Capture Packets subsystem)	UDP/9177and UDP/37008
FTP	TCP/20 and TCP/21
H.323v1 flow detection.	TCP/1720

© 2012 Meru Networks, Inc.

Traffic	Port
HTTP	TCP/8080
HTTPS	TCP/443
Inter-controller roaming	UDP/9394
Meru L3 AP COMM	UDP/5000
Licensing - for connections initiated from within the controller only for licensing purposes (e.g. wncagent -> merud)	TCP/32780
Meru L3 AP Data	UDP/9393
Meru L3 AP Discovery/Keepalive	UDP/9292
NP1 advertisements / config	UDP/9980
NTP	UDP/123
Radius accounting	1813 / 1646
Radius auth	1812 / 1645
SIP	UDP/TCP 5060
SSH	TCP/22
SNMP	UDP/161 and 162
Syslog	UDP/514
TFTP	UDP/69
UDP broadcast up to 5 upstream/downstream configurable	UPD/xxx
TACACS+	TCP/49
Telnet	TCP/23
Controller packet capture	UDP/9177
WIPS	UDP/9178
WireShark, OmniPeek, Newbury	UDP/9177
SAM (AP and server)	EtherIP 97

 © 2012 Meru Networks, Inc.

Chapter 5
Configuring an ESS

A basic service set (BSS) is the basic building block of an IEEE 802.11 wireless LAN; one access point together with all associated clients is called a BSS. An AP acquires its clients by broadcasting its name (SSID) which is picked up by clients within range. Clients can then respond, establishing a connection. It is legitimate for multiple access points to share the same SSID if they provide access to the same network as part of an Extended Service Set (ESS). You can establish different kinds of ESS for different situations such as:

- a VLAN that supports multiple access points per ESS.
- several different ESSs on one physical access point.
- a VLAN for each ESS to separate network traffic. You can also specify that a VLAN be shared between multiple ESSs.
- an ESS that supports just one person.
- an ESS for a remote AP, such as in a branch office. That AP can additionally support ESSs for local traffic.
- an ESS divided to support different security requirements. For example, you can set up an ESS such that clients who use WPA are placed into a VLAN named *vlan10*, and clients who enter the network in Open mode are placed into a VLAN named *vlan20*. (For information about configuring security, see Chapter 8, “Configuring Security” on page 113).

The Meru Wireless LAN System also allows you to customize a beacon per ESS to support different access point settings, such as base or supported transmit rates, different BSSs, different beacon intervals, and different DTIM periods. This beacon customization allows service customization for each ESS, as well as more flexibility in supporting different clients and services.

ESS profiles for a controller can also be configured from E(z)RF Network Manager. You can tell where an ESS was configured by checking the read-only field Owner. The Owner is either **nms-server** or **controller**. AP1000 can simultaneously support an ESS with Virtual cell and another ESS without Virtual Cell; AP300 cannot do this.

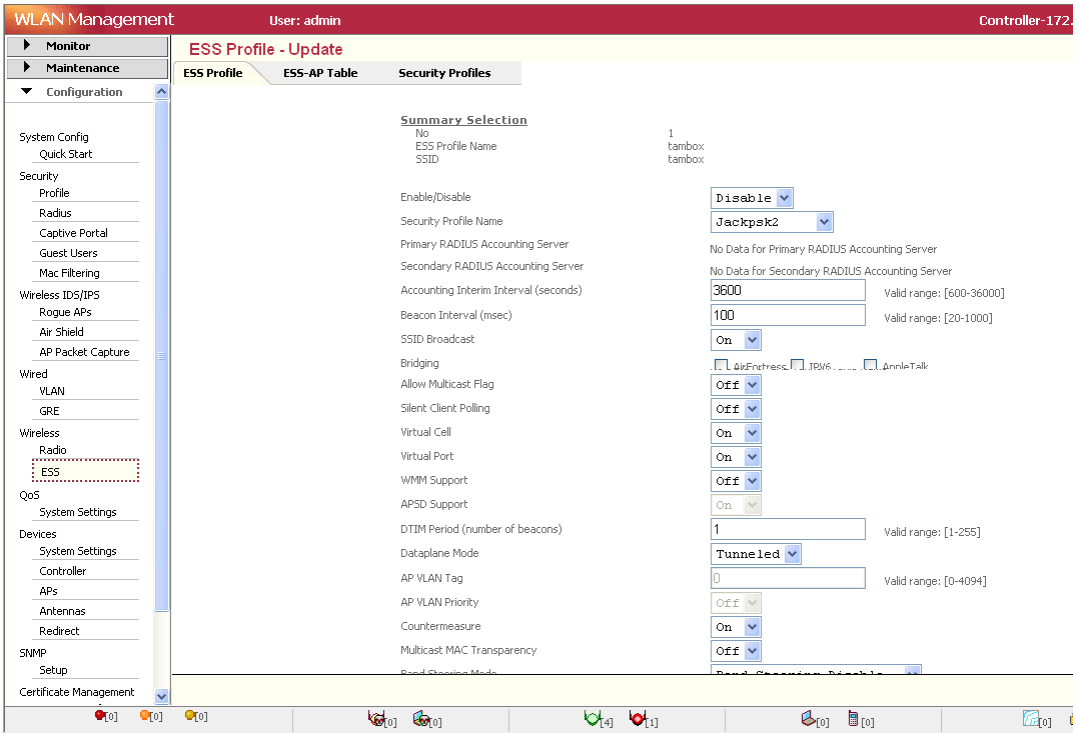
© 2012 Meru Networks, Inc.

Add an ESS with the Web UI

ESS profiles can be configured either from E(z)RF Network Manager or from the controller. You can tell where an ESS profile was configured by checking the read-only field Owner; the Owner is either **nms-server** or **controller**. AP300/AP400 is designed to use either a Virtual Cell ESS or a non-Virtual Cell ESS, but not both at once. AP1000 is designed to use a Virtual Cell ESS and a non-Virtual Cell ESS simultaneously. To add an ESS from the controller's Web UI, follow these steps:

1. Click **Configuration > Wireless > ESS > Add**.
   The ESS Profile Add screen displays - see below.

Figure 6: Adding an ESS Profile



2. In the ESS Profile Name field, type the name (ID) of the extended service set. The name can be up to 32 alphanumeric characters long with no spaces.
3. In the SSID field, type a name up to 32 characters for the SSID for this ESS. (Note that when you are creating either Virtual Cell overflow or a non-Virtual Cell ESS, you will be creating two ESS Profiles with the same ESSID. See **Configure Virtual Cell Overflow with the Web UI** for details.)
4. In the Security Profile Name list, select an existing Security Profile to associate with the ESS profile. By default, an ESS profile is associated with the Security Profile named default. For more explanation, see **Security Profiles for an ESS**.

© 2012 Meru Networks, Inc.

5. In the Primary Radius Accounting Server list, select either the name of a previously configured Radius accounting server profile or the **No RADIUS** option. Selecting the **No RADIUS** option means that no Radius accounting messages will be sent for clients connecting to this ESSID profile. For more information, see the authentication chapter **Radius Accounting for Clients**.
6. In the Secondary Radius Accounting Server list, select the name of a previously configured Radius accounting server profile or the **No RADIUS** option. If No Radius is selected, then no Radius accounting messages will be sent for clients connecting to this ESSID profile. For more information, see the security chapter **Radius Accounting for Clients**.
7. In the Accounting Interim Interval field, type the time (in seconds) that elapses between accounting information updates for Radius authentication. If a Radius accounting server is enabled, the controller sends an interim accounting record to the Radius server at the interval specified. Accounting records are only sent to the Radius server for clients that authenticate using 802.1x. The interval can be from 600 through 36,000 seconds (10 minutes through 10 hours). The default value is 3,600 seconds (1 hour). For more information, see the security chapter **Radius Accounting for Clients**.
8. Beacon Interval sets the rate at which beacons are transmitted. Setting the beacon interval to a higher value decreases the frequency of unicasts and broadcasts sent by the access point. If the power-save feature is enabled on clients that are connected to access points, clients “wake up” less if fewer unicasts and broadcasts are sent, which conserves the battery life for the clients. In the Beacon Interval field, type the interval (in ms) at which beacons are transmitted. The beacon interval must be between 20 through 1000 milliseconds. For AP300/AP400 and AP1000, beacon interval is a multiple of 20, from 20 to 1000ms. For AP150 and OAP180, the beacon interval is a multiple of 100, from 100 to 500ms. If your WLAN consists mostly of Wi-Fi phones, and you have a low number of ESSIDs configured (for example, one or two), Meru Networks recommends setting the beacon interval to 100.
9. In the SSID Broadcast list, select one of the following:
   - **On**: SSID is included in the beacons transmitted.
   - **Off**: SSID is not included in the beacons transmitted. Also Probe Responses will are not sent in response to Probe Requests that do not specify an SSID.
10. In the Bridging area, check any of these bridging options:
    - **AirFortress**: FortressTech Layer 2 bridging and encryption with Fortress Technology AirFortress gateway.
    - **IPv6**: Configures bridging Internet version 6 addresses. IPv6 via tunneling mode has these limitations:
      - No dynamic VLAN
      - No multiple ESSID mapping to same VLAN
      - No support for IPv6 filtering
      - No IPv6 IGMP snooping
    - **AppleTalk**: configures bridging to AppleTalk networks on this ESS.
11. By default, access points that join the ESS profile and have the same channel form a Virtual Cell. In the New APs Join ESS profile list, select one of the following:

© 2012 Meru Networks, Inc.

- **On**: (default) Access points automatically join an ESS profile and are configured with its parameters.
- **Off**: Prevents access points from automatically joining an ESS profile. The user is now allowed to add multiple interfaces on the ESS Profile screen. Perform the following steps to add multiple interfaces:
  - On the **ESS Profile - Update** screen select the **New APs Join ESS** profile as **Off**. This option prevents the APs from automatically joining an ESS profile.
  - Select the checkbox for an ESS profile and click the **Settings** button.
  - The **ESS Profile - Update** screen is displayed.
  - On the **ESS Profile - Update** screen, select the **ESS-AP Table** tab.
  - The **ESS-AP Configuration** screen is displayed. No information is displayed on the **ESS-AP Configuration** screen.
  - On the **ESS-AP Configuration** screen, click the **Add** button.
  - The **ESS-AP Configuration - Add** screen is displayed. Here, the user is now allowed to add multiple interfaces on the ESS Profile screen.
  - Click **OK**.
  - The selected interfaces are now displayed on the **ESS-AP Configuration** screen.

12. In the Tunnel Interface Type, select one of the following:
    - **No Tunnel**: No tunnel is associated with this ESS profile.
    - **Configured VLAN Only**: Only a configured VLAN listed in the following VLAN Name list is associated with this ESS profile. If you select this option, go to Step 13.
    - **Radius VLAN Only**: The VLAN is assigned by the Radius server via the Radius attribute **Tunnel Id**. Use **Radius VLAN Only** when clients authenticate via 802.1x/WPA/WPA2 or MAC Filtering.
    - **Radius and Configured VLAN**: Both a configured VLAN and Radius VLAN are associated with this ESS profile. If you select this option, proceed to Step 15.
    - **GRE**: Specifies a GRE Tunnel configuration If you select this option, go to Step 14. For details, see the security chapter **Configure GRE Tunnels**.
13. If you selected **Configured VLAN Only** in Step 12**,** select a VLAN from the list to associate with this ESS profile.
14. If you selected **GRE** for Tunnel Interface Type**,** select the name of a GRE Tunnel profile previously configured in the **Configuration > Wired > GRE** area. For GRE to work, DHCP relay must be enabled either locally or globally. Also see
15. In the Allow Multicast Flag list, optionally enable multicasting (**on**). Only enable multicasting if you need to use a multicast application. Enabling multicasting causes all multicast packets on the air side to appear on the wired side, and all multicast packets on the wired side to appear on the air side. Also see **Multicasting Feature** in this chapter.
    - **On**: Enables multicasting. Enable multicasting only if you need to use a multicast application. Enabling multicasting causes all multicast packets on the air side to appear on the wired side, and all multicast packets on the wired side to appear on the air side.

 © 2012 Meru Networks, Inc.

Caution! Multicasting is allowed only when an ESS profile has a one-to-one mapping with the default VLAN for this ESS profile. No other ESS profile can use the same VLAN and security rules associated with this ESS profile must not redirect traffic to another VLAN. Multicasting is an advanced feature. Enable multicasting only if you need to use a multicast application. Enabling multicasting causes all multicast packets on the air side to appear on the wired side, and all multicast packets on the wired side to appear on the air side.

- **Off**: Disables multicasting.

16. Silent Client Polling is used with Virtual Cell to track wireless clients that roam without transmitting (for example, phones and other devices that conserve battery life). This feature is enabled by default. In the Silent Client Polling list, select one of the following:
    - **On**: (default) Tracking information is sent between the controller and APs, and also sent between the APs and a phone that is not in a call or in powersave mode. This feature keeps the system appraised of a client phone location if the client moves between APs while the phone is inactive.
    - **Off**: Disables silent client polling.
17. Virtual Cell (which includes Virtual Port) is on by default; this affects AP300, AP400, and AP1000. On the AP1000, Virtual Cell is controlled exclusively by the settings here. You can create any combination of Virtual Cell ESS profiles and non-Virtual Cell ESS profile and use them on an AP1000 radio. For AP300s and AP400s, this setting is not the only factor that affects Virtual Cell - the Dot11 radio interface setting for each radio also controls Virtual Cell on each AP. They both must on for Virtual Cell to work. See **When is Virtual Cell Really on for an AP?** for details.

    To enable/disable Virtual Cell on this ESS, select one of the following:
    - **On**: (default) Access points on the same channel share the same BSSID, forming a Virtual Cell (default). Note that if an ESSID profile is configured for Virtual Cell, but an AP300/AP400 radio interface providing that EESID service is non-Virtual Cell, the service will be non-Virtual Cell on that radio interface. Conversely, if an AP300/AP400 radio is configured for Virtual Cell, but either the ESSID Virtual Cell setting is off or Virtual Port is off, no service will be provided by that radio. The radio must have Virtual Cell on and the ESSID profile must have both Virtual Cell and Virtual Port on for the service to be Virtual Cell. See **When is Virtual Cell Really on for an AP?** for details.
    - **Off**: Prevents APs on the same channel from sharing the same BSSID.

Note: All APs on the same channel in a Virtual Cell must have the same setting for these values:

- RF-Mode
- Channel Width
- N-only Mode

© 2012 Meru Networks, Inc.

Note: If you set Virtual Cell on for an ESS used with AP300s or AP400s and then turn it off, Virtual Cell capability is removed from the interface and must be added to the interface again if Virtual Cell is turned on again in the ESS. To add the SSID back to AP300 or AP400, the best option is to delete the ESS profile and then re-add it. Alternately, you can add a BSSID to each and every interface manually. Note with this last option, if there are multiple APs in network then this option does not help.

18. In Release 5.1, the Virtual Port setting has no effect. Virtual Port is on if Virtual Cell is on and off if Virtual Cell is off.
19. If Virtual Cell is **off** and the APs are any AP300 or AP400 model, you can make this ESS an "overflow" ESS by selecting a Virtual Cell ESS for the **Overflow for:** setting. This means that when the named Virtual Cell ESS (that was created earlier) maxes out, it will overflow into this non-Virtual Cell ESS. This works by having the two ESS Profiles share an SSID so they can seamlessly move clients back and forth as needed. For more explanation, see **Virtual Cell Overflow Feature**.
20. In release 5.1, WMM configuration in the ESSID has no effect. However, in order to enable or disable APSD features across APs, the WMM parameter must be set to **on**. WMM Classification for different traffic patterns is not supported by AP150 models. For more information, see **WMM Features Supported by System Director**.
21. For APSD support, select **on** or **off**. APSD stands for Advanced WMM Power Save and is supported AP300/AP400/AP1000. For more explanation, see **WMM Features Supported by System Director**.

    On: Data packets for powersave mode clients are buffered and delivered based on the trigger provided by the client. This feature saves more power and provides longer lifetime for batteries than the legacy power save mode (TIM method). Note that you must have WMM set to on for this to work - see previous step.

    Off: No APSD support.
22. DTIM affects clients in power save mode. In the DTIM Period field, type the number of beacon intervals that elapse before broadcast and multicast frames stored in buffers are sent. This value is transmitted in the DTIM period field of beacon frames.

    The DTIM period can be a value from 1 through 255. The default DTIM period is 1. Setting the DTIM period to a higher value decreases the frequency of broadcasts sent by the access point. If power save is enabled on clients that are connected to access points, clients "wake up" less if fewer broadcasts are sent, which conserves battery life for the clients.

    Only the behavior of clients currently in power-save mode is affected by the DTIM period value. Because broadcasts are generally wasteful of air resources, the Meru WLAN has devised mechanisms that mitigate broadcasts either with proxy services or with more efficient, limited unicasts. As an example, ARP Layer 2 broadcasts received by the wired side are not relayed to all wireless clients. Instead, the Meru controller maintains a list of IP-MAC address mappings for all wireless clients and replies with proxy-ARP on behalf of the client.
23. In the Dataplane Mode list, select the type of AP/Controller configuration:
    - **Tunneled**: (default) In tunneled mode, a controller and an AP300/AP1000 are connected with a data tunnel so that data and control packets from a mobile station are tunneled to the controller from the AP and vice versa.

 © 2012 Meru Networks, Inc.

- **Bridged**: (Bridged mode was formerly Remote AP mode.) In bridged mode, data packets are not passed between AP300/AP1000 and the controller; only control plane packets are passed. When bridged mode is configured in 5.1, an AP300 or AP1000 can be installed and managed at a location separated from the controller by a WAN or ISP, for example at a satellite office. The controller monitors the remote APs through a keep-alive signal. Remote APs can exchange control information with the controller, including authentication and accounting information, but they are unable to exchange data. Remote APs can, however, exchange data with other APs within their subnet. ESSIDs in bridged mode cannot exchange dataplane traffic (including DHCP) with the controller and the following System Director features are not available in a bridged configuration: Rate Limiting, and QoS (and all QoS-related features). For more explanation, see **Bridging Versus Tunneling** in this chapter.

  A VLAN tag can be configured for a Bridged mode profile (see Step 28 below) and then multiple profiles can be associated to that VLAN tag. The AP VLAN priority can be set in Step 26 below.

24. Provide an AP VLAN tag between zero and 4094. This VLAN tag value is configured in the controller VLAN profile and is used for tagging client traffic for ESSIDs with dataplane mode bridged, using 802.1q VLAN. This field indicates whether an AP needs to map incoming VLAN 802.1p data packets into WMM ACs or not. By default in a bridged ESS, this field is disabled and an AP always honors DSCP field in IPV4 packet to map an incoming packet to one of WMM ACs. When turned on, an AP honors VLAN 802.1p priority over DSCP priority when the packet is mapped into one of WMM ACs.
25. To Enable VLAN Priority, set this field to On.
    - **On**: AP disregards the DSCP value in the IP header of a packet.
    - **Off**: AP honors the DSCP values in the IP header of a packet. AP converts the DSCP value in the IP header to appropriate WMM queues. This feature works only for downstream packets and only for an ESSID with dataplane mode set to **bridged**.
26. For Countermeasure, select when to enable or disable MIC Countermeasures:
    - **On**: (default) Countermeasures are helpful if an AP encounters two consecutive MIC errors from the same client within a 60 second period. The AP will disassociate all clients from the ESSID where the errors originated and not allow any clients to connect for 60 seconds. This prevents an MIC attack.
    - **Off**: Countermeasures should only be turned off temporarily while the network administrator identifies and then resolves the source of a MIC error.
27. In the Enable Multicast MAC Transparency field, indicate **on** or **off**. For more explanation, see **Multicast MAC Transparency Feature** in this chapter.
    - **On**: All downstream multicast packets will have the MAC address of the streaming station.
    - **Off**: (default) All downstream multicast packets will have the MAC address of the controller.
28. Band steering balances multi-band capable clients on AP300/AP1000 by assigning bands to clients based on their capabilities. To use band steering for ABGN traffic, you could use A-steering to direct dual mode clients with A capability to the 5GHz band and use N-steering to direct all dual mode clients with AN capability to the

© 2012 Meru Networks, Inc.

5GHz band. Band steering is also useful for directing multicast traffic. For this command to work as clients are added, also set the field New APs Join ESS to on. For more explanation, see **Band Steering Feature** in this chapter.Band Steering Mode options are:

- **Band Steering Disabled**
- **Band Steering to A band**: Infrastructure attempts to steer all A-Capable wireless clients to the 5GHz band when they connect to this ESS.
- **Band Steering to N band:** Infrastructure attempts to steer all N-Capable wireless client that are also A-Capable to the 5GHz band when they connect to this ESS. Infrastructure also attempts to steer non N-Capable wireless clients to the 2.4GHz band.

29. Band Steering Timeout sets the number of seconds that assignment for a steered client is blocked on the forbidden band while it is unassociated. For this command to work, also set the field Band Steering to A-band or N-band (see above). Band Steering Timeout can be any integer from 1-65535.
30. **Expedited Forward Override** option is implemented to override the system's default DSCP-to-WMM priority mapping. IP datagrams marked with DSCP Expedited Forwarding (46) will be sent from the WMM Voice queue (AC_VO) of the AP rather than the Video queue (AC_VI) in downstream (to stations). This feature is specific to AP300 and is disabled by Default. It is configured on a per-ESS Profile basis and works in both bridged and tunneled ESS profiles. For configuration, see **Expedited Forward Override** in this chapter.
31. **SSID Broadcast for Vport** is specific to address the CISCO phone connectivity issues. It consists of three options as follows:
    - **Disable**: This is the default configuration on the ESSID profile page. Configuring the parameter to "Disable" makes the AP not to advertise the SSID string in the beacon.
    - **Always**: Configuring the parameter to "Always" enables the AP to advertise the SSID on the beacons always. This must not be configured unless recommended.
    - **Till-Association**: Configuring the parameter to "Till-Association" enables the AP to advertise the SSID in the beacons till association stage of the client and disable the SSID broadcast in the later part of connectivity. This parameter is preferable to configure for the certain version of phones which will resolves the connectivity issues with the Vport ON. Once station associated, AP320 will stop broadcasting SSID string. Here the users are allowed to configure SSID broadcast for VPort parameter from controller GUI per ESS basis in addition to AP CLI. For configuration, see **SSID Broadcast for Vport** in this chapter.
32. For the remaining Supported and Base Transmit Rates for B, A, G, and BG modes, enable or disable rates as needed.
33. Click **OK**.

Note: If Ascom i75 phones are used to connect to WPA2PSK profile with VCell enabled, then create an ESSID with all BGN Supported HT Transmit rates unchecked (set to none).

 © 2012 Meru Networks, Inc.

When is Virtual Cell Really on for an AP?

AP1000 is always ready to use Virtual Cell or Virtual Port; no configuration at the radio level is necessary. To enable either of them, simply configure them as **on** in each ESS profile. If neither is desired, the AP can be used in a non-virtual (or legacy) environment.

For AP300, Virtual Cell is enabled on the **radio interface** by default, and it can be disabled as desired. This setting overrides any Virtual Cell configuration at the ESS-level, i.e., if you turn Virtual Cell off at an AP300 radio, then Virtual Cell is off for that radio, even if the ESS in use has Virtual Cell configured. Both the radio and the ESS in use must have Virtual Cell enabled for AP300 to work.

The following table illustrates the three possible configurations for the AP300:

	Radio Virtual Cell	ESS Profile VCell and VPort	ESSIDs are...
AP300	on	on	Virtualized
	off	off	Not Virtualized
	off	on	Not Virtualized

There are two steps for configuring AP300 Virtual Cell:

1. Create an ESS with Virtual Cell **On** (default); for directions, see **Add an ESS with the Web UI**.
2. Configure each AP300 radio for Virtual Cell by following these steps:
   a. Click **Configure > Wireless > Radio**.
   b. Select a radio.
   c. Save the configuration.

Adding an ESS with the CLI

Assigning an ESSID with the CLI

The ESSID is the ESS name that clients use to connect to the WLAN. An ESSID can be a string of up to 32 alphanumeric characters long. Do not use spaces or special characters.

The following example names an ESS *corp-users* and enters ESSID configuration mode:

© 2012 Meru Networks, Inc.

```
controller# configure terminal
controller(config)# essid corp-users
controller(config-essid)#
```

Enable and Disable

The **Enable and Disable** field represents all the **Enabled** and **Disabled** services of a profile. If a specific ESS profile is *Disabled*, the NMS deletes all the *Services* that belong to the ESS profile. If a specific ESS profile is *Enabled*, the NMS creates all the *Services* that belong to the ESS profile. A client will not associate to the ESSID profile when its state is disabled.

Note: The "Service" refers to client connectivity. When the ESSID state is disabled, the BSSID is removed from the AP and the client will not be able to view the Disabled SSID on air.

CLI Configuration

```
MERUCNTRL# sh essid
```

ESS Profile Name	Enable/Disable	SSID	Security Profile	Broadcast	Tunnel Interface Type
meru	enable	meru	default	on	none
meruwpa	enable	meruwpa	meruwpa	on	none
meruwpa2psk	enable	meruwpa2psk	meruwpa2psk	on	none

```
ESS Profile(3)
MERUCNTRL# configure terminal
MERUCNTRL(config)# essid meru
MERUCNTRL(config-essid)# disable
MERUCNTRL(config-essid)# end
MERUCNTRL# sh essid
```

Security Profiles for an ESS

ESS profiles and Security profiles can be configured either from E(z)RF Network Manager or from the controller. You can tell where a profile was configured by checking the read-only field Owner; the Owner is either **nms-server** or **controller**. Each ESS must be associated with a security profile. If you do not create additional security profiles, an ESS is automatically associated with the default security profile named *default*. To use additional security profiles, create them using the **security-profile** command in global configuration mode (see either this chapter, **Add an ESS with the Web UI** or **Chapter 8, "Configuring Security,"** for details). Create the security profile before creating the ESS. You cannot alter profiles created in E(z)RF Network Manager from a controller.

The following CLI example associates a security profile named corp-access:

```
controller(config-essid)# security-profile corp-access
controller(config-essid)#
```

Configuring CAC for an ESSID AP with the CLI

If implemented, Call Admission Control (CAC) limits the number of VoIP calls for all BSSIDs with the command **qosvars calls-per-bssid** (see **"Configuring QoS Rules With the CLI" on page 237**). If you have special requirements for an ESSID's AP300, you can set the CAC maximum calls limit specifically for the ESS using the **calls-per-bss** command from the essid/ess-ap configuration sublevel. For example, to set a maximum of 10 calls for AP 1, interface 1 in the ESSID, use the following command:

```
controller(config-essid)# ess-ap 1 1
controller(config-essid-essap)# calls-per-bss 10
controller(config-essid-essap)# exit
```

Configuring Beacon Parameters with the CLI

You can set the following beacon parameters:

- Beacon DTIM period—DTIM affects clients in power save mode. In the DTIM Period field, type the number of beacon intervals that elapse before broadcast frames stored in buffers are sent. This value is transmitted in the DTIM period field of beacon frames.

 © 2012 Meru Networks, Inc.

The DTIM period can be a value from 1 through 255. The default DTIM period is 1. Setting the DTIM period to a higher value decreases the frequency of broadcasts sent by the access point. If power save is enabled on clients that are connected to access points, clients “wake up” less if fewer broadcasts are sent, which conserves battery life for the clients.

Only the behavior of clients currently in power-save mode is affected by the DTIM period value. Because broadcasts are generally wasteful of air resources, the Meru WLAN has devised mechanisms that mitigate broadcasts either with proxy services or with more efficient, limited unicasts. As an example, ARP Layer 2 broadcasts received by the wired side are not relayed to all wireless clients. Instead, the Meru controller maintains a list of IP-MAC address mappings for all wireless clients and replies with proxy-ARP on behalf of the client.

- Beacon interval—Sets the rate at which beacons are transmitted.

  The beacon period setting affects unicasts and broadcasts. The beacon interval must be between 20 through 1000 milliseconds. For AP300 and AP1000, beacon interval is a multiple of 20, from 20 to 1000ms. For AP150 and OAP180, the beacon interval is a multiple of 100, from 100 to 500ms. Setting the beacon interval to a higher value decreases the frequency of unicasts and broadcasts sent by the access point. If the power-save feature is enabled on clients that are connected to access points, clients “wake up” less if fewer unicasts and broadcasts are sent, which conserves the battery life for the clients. The beacon period setting affects unicasts and broadcasts.

  If your WLAN consists mostly of Wi-Fi phones, *and* you have a low number of ESSIDs configured (for example, one or two), Meru Networks recommends setting the beacon interval to 100.

The following example sets the beacon DTIM period to 10 and beacon interval to 240 TUs:

```
controller(config-essid)# beacon dtim-period 10
controller(config-essid)# beacon period 240
```

Configuring ESSID Broadcasting with the CLI

By default, an ESSID is broadcast. When an ESSID is broadcast, it is included in the advertised beacon. Clients using passive scanning listen for beacons transmitted by access points. If ESSID broadcasting an is disabled, those clients listening for beacons cannot receive ESSID information.

Clients using active scanning send probe requests and wait for probe responses from access points. If broadcasting an ESSID is disabled, access points do not respond to probe requests, unless the probe request includes the ESSID.

To prevent the ESSID from being broadcast, use the **no publish-essid** command.

The following example prevents the ESSID from being broadcast:

```
controller(config-essid)# no publish-essid
```

© 2012 Meru Networks, Inc.

Configuring ESSID Joining of Access Points with the CLI

By default, when a new access point is plugged into the WLAN, it joins all ESSIDs that are configured to have new access points automatically join upon discovery and a BSSID is created.

After you are satisfied with your WLAN configuration, you can disable the automatic joining so that new access points do not change your configuration. If you are adding a new ESS that you want to advertise on only a small subset of access points, it is easier to disable joining and add the ESS-AP mappings manually.

The following example prevents access points from automatically joining an ESSID:

```
controller(config-essid)# no ap-discovery join-ess
```

After preventing automatic joining, a BSSID must be assigned manually.

Caution! The status of this command is only evaluated when new ESS-AP mappings are created. ESS-AP mappings are either created manually with the **ess-ap** command, or automatically when a new ESS is created, or a new access point is discovered.

Configuring Virtual Cell Support

Virtual Cell is on by default for Meru access points. The major benefit of Virtual Cell is infrastructure-controlled handoffs with seamless roaming between access points.

AP300 Virtual Cell differs from other Virtual Cell configuration in these ways:

- Virtual Cell has to be enabled per AP300 radio interface, in addition to the ESS Profile configuration. Both the radio and the ESS in use have to have Virtual Cell enabled for it to work. Virtual Cell is enabled by default on Meru AP300.
- If you configure some AP300s in a Virtual Cell-enabled ESS Profile for Virtual Cell and others for non-Virtual Cell, only the Virtual Cell-configured AP300s are recognized by the Virtual Cell enabled ESS.
- In the Wireless Interface Configuration, the setting Virtual Cell Mode enables Virtual Cell on AP300 radios only.
- AP300 only supports per-station Virtual Cell.
- AP300 and AP200 cannot share a Virtual Cell.

Configuring Virtual Cell Support for AP300 or AP400 with Web UI

Virtual Cell is enabled by default on Meru AP300/AP400. However, if you turn Virtual Cell off at an AP300/AP400 radio then Virtual Cell is off for that radio, even if the ESS in use has Virtual Cell configured. Both the radio and the ESS in use have to have Virtual Cell enabled for it to work.There are two steps (instead of just the first one below for AP150) for configuring Virtual Cell:

1. Create an ESS with Enable Virtual Cell **On** and Virtual Port **On**. (These two settings default to **On**.)

 © 2012 Meru Networks, Inc.

2. Configure each radio for Virtual Cell by following these steps:
   a. Click **Configure > Wireless > Radio**
   b. Select a radio.
   c. Set Virtual Cell as “On”
   d. Save the configuration.

Note: Configure multiple radios with Bulk Update.

Configuring Virtual Cell Support for AP300 or AP400 with the CLI

Virtual Cell is enabled by default on Meru APs. However, note that if you turn Virtual Cell off at an AP300/AP400 radio then Virtual Cell is off for that radio, even if the ESS in use has Virtual Cell configured. Both the radio and the ESS in use have to have Virtual Cell enabled for the AP to use Virtual Cell. (This does not apply to AP1000.)

You can see the Virtual Cell setting by using the CLI command **show interfaces Dot11Radio**. For example:

```
vcell22# show interfaces Dot11Radio 2 1
Wireless Interface Configuration

Number of Antennas                   : 3
Dual abg Support                     : off
Channel Width                        : 20-mhz
MIMO Mode                            : 2x2
```

© 2012 Meru Networks, Inc.

```
802.11n only mode                       : off
Virtual Cell mode                       : on        <-
```

To turn Virtual Cell off, use this version of the command:

```
vcell22(config-if-802)# no virtual-cell
```

Note: All APs on the same channel in a Virtual Cell must have the same setting for these values:

- RF-Mode
- Channel Width
- N-only Mode

Configuring Virtual Cell Support for AP150

AP150 Virtual Cell is enabled by default. The following command disables Virtual Cell for AP150s (note that the command is issued from Global Configuration mode, and not the ESSID submode):

```
controller(config)# vcellap150 disable
```

The following command enables Virtual Cell for AP150s (note that the command is issued from Global Configuration mode, and not the ESSID submode):

```
controller(config)# vcellap150 enable
```

The **virtual-port** setting determines how the BSSID is populated. To add or edit this, click **Configuration > Wireless > ESS**.

Note: Note that Shared BSSID configuration is enabled in the ESSID profile example above. This is required because AP150 does not forward data packets to power save clients when using Virtual Cell.

Virtual Port is Now Part of Virtual Cell

In release 5.1, Virtual Cell includes Virtual Port. If Virtual Cell is on, so is Virtual Port. They cannot be configured separately; it is all one feature that is turned on and off by the Virtual Cell setting when you **Add an ESS with the Web UI**.

AP300, AP400, and AP1000 support Virtual Port. AP150 and OAP180 do not support Virtual Port

Virtual Port enhances Virtual Cell by giving each client its own virtual access point. With Virtual Port, each client has its own access instead of sharing access with other clients. Because each client has its own Virtual Port, you can tailor it to match the client's needs. For example, different employees can be given different amounts of bandwidth, depending on the applications used in their jobs. A voice client can be given limited bandwidth but high quality of service. A guest is given lower priority and restricted access.

There are three types of limits on the number of Virtual Ports per controller:

 © 2012 Meru Networks, Inc.

- **Restricted by the number of clients** supported by the controller
- **Restricted by the number of AP radios** On AP300/AP400, the theoretical maximum number of Virtual Ports is 128 per radio. Meru's best practices recommendation is to have no more than 64 per radio.
- **Restricted by Virtual Cell** There is a hard limit of 2007 Virtual Ports per Virtual Cell. This number is set by the standard of having no more than 2007 associations per single BSSID. In Meru's environment, each BSSID represents a Virtual Cell.

Configuring Probe Response Threshold

The **Probe Response Threshold** configures the way in which an AP responds to requests based on its distance from the transmitting device. It is designed to ensure that the AP responds more swiftly to requests sent from stations located nearby. It is configurable through GUI support in addition to the AP CLI. This feature is also configured via bulk update on a per-AP interface level. The default probe response threshold on AP is 15.

This value can be viewed by connecting to `<AP ID>`

```
Radio show radio0/1

ic_meru.icm_rssiThreshold               = 15
```

Change in CLI

To change SNR value to 20

```
ap 7>
ap 7> radio prt radio0 threshold 20

Verify using radio show radio0

ap 7> radio show radio0
============================
===         radio0        ===
============================
Device Name                             = radio0
If index                                = 0
If Mode                                 = 11NG

ic_meru.icm_rssiThreshold               = 20
ic_meru.nodeallocated                   = 7
ic_meru.nodefreed                       = 3
ic_meru.icm_ibss_prot                   = off
```

© 2012 Meru Networks, Inc.

Configuring Probe Response Threshold:

```
ap 7> radio help prt
radio {probe-resp | prt} <radio-name> assigned <snr>|all
<snr>|threshold <snr>|maxresp
<maxcount>
set probe response assigned/rssi threshold/max response count.

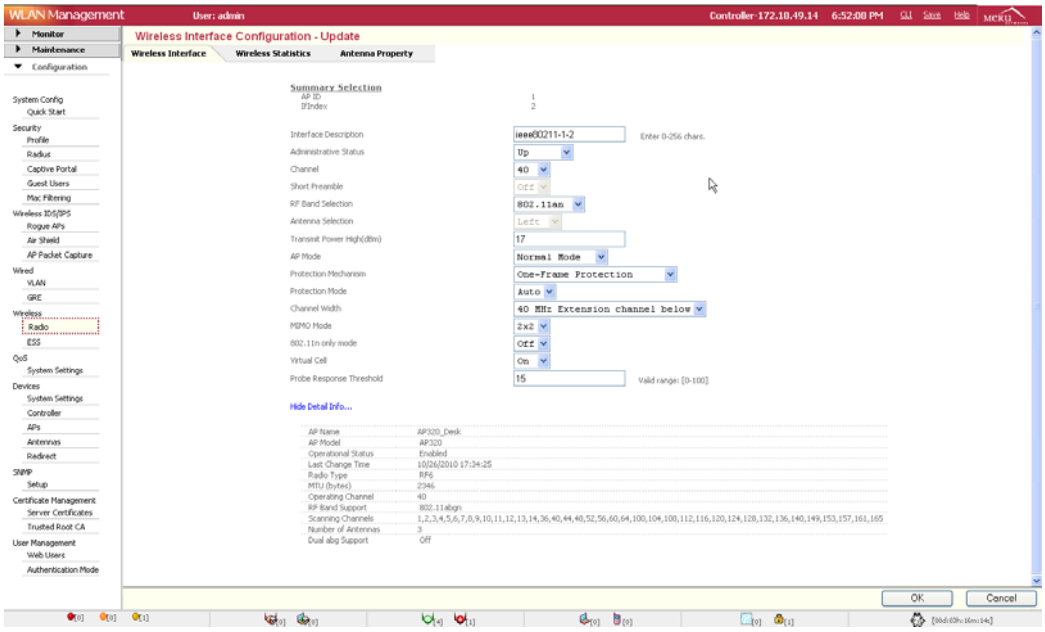
radio probe-resp <radio-name> assigned <SNR>|all <SNR>|threshold
<SNR>|maxresp <maxcount>
SNR threshold value or Max broadcast probe response count
(0 <= SNR <= 100) 0 disables
(0 <= maxcount <= 128) 0 disables broacast probe response
```

SNRRange

The GUI must have the SNR value ranging from 0 to 100, zero means probe response threshold disable.

GUI Page:

Figure 7: Wireless Interface Configuration - Update



Configuring Silent Client Polling with the CLI

Use silent client polling to allow tracking information to be sent between the controller and the APs and between the AP and a phone that is not in a call or using powersave. This feature keep the system appraised of a client phone location if the client moves between APs while the phone is inactive.

 © 2012 Meru Networks, Inc.

```
default(config-essid)# silent-client-enable

default(config-essid)# no silent-client-enable
default(config-essid)# end
```

Configuring Data Transmit Rates with the CLI

Note: The AP150 does not support configuration of the Base/Supported data rates. The default settings in use for these products are:

- 802.11b: Base (1,2,5.5,11), Supported (1,2,5.5,11)
- 802.11bg: Base (1,2,5.5,11), Supported (all)
- 802.11a: Base (all), Supported (all)

Any data transmit rate settings made in the ESSID are ignored by AP150.

The data transmit rate is the data rate that the access points use to transmit data. There are two types of data rates:

- Base data transmit rates
  Mandatory rates that all connecting clients must support when connecting to access points. For 802.11AN/BGN, the data rate is selected using MCS Index. The actual data rate is computed based on MCS Index, Channel Width, and Guard Interval. When channel width selected is 40MHz Extension above, then the data rate for the client depends on associated clients channel width and guard interval capabilities. Valid rates are as follows:
  - 802.11b valid rates are 1, 2, 5.5, 11 Mbps, or all
  - 802.11g valid rates are 6, 9, 12, 18, 24, 36, 48, 54 Mbps, or all
  - 802.11bg valid rates are 1, 2, 5.5, 11, 6, 9, 12, 18, 24, 36, 48, 54 Mbps, or all
  - 802.11bgn valid rates are 1, 2, 5.5, 11, 6, 9, 12, 18, 24, 36, 48, 54 Mbps, or all
  - 802.11a valid rates are 6, 9, 12, 18, 24, 36, 48, 54 Mbps, or all
  - 802.11an valid rates are 6, 9, 12, 18, 24, 36, 48, 54, or all
  - 802.11an-mcs valid rates are MCS 0, MCS 1, MCS 2, MCS 3, MCS 4, MCS 5, MCS 6, MCS 7, MCS 8, MCS 9, MCS 10, MCS 11, MCS 12, MCS 13, MCS 14, MCS 15, or all
  - 802.11bgn-mcs valid rates are MCS 0, MCS 1, MCS 2, MCS 3, MCS 4, MCS 5, MCS 6, MCS 7, MCS 8, MCS 9, MCS 10, MCS 11, MCS 12, MCS 13, MCS 14, MCS 15, or all
- Supported data transmit rates
  Rates at which clients can optionally connect, provided the clients and access points support the rates. Valid rates are as follows:
  - 802.11b valid rates are 1, 2, 5.5, 11 Mbps, or all
  - 802.11g valid rates are 6, 9, 12, 18, 24, 36, 48 and 54 Mbps, or all
  - 802.11bg valid rates are 1, 2, 5.5, 11, 6, 9, 12, 18, 24, 36, 48 and 54 Mbps, or all
  - 802.11bgn valid rates are 1, 2, 5.5, 11, 6, 9, 12, 18, 24, 36, 48 and 54 Mbps, or all
  - 802.11a valid rates are 6, 9, 12, 18, 24, 36, 48, and 54 Mbps, or all

© 2012 Meru Networks, Inc.

- 802.11an valid rates are 6, 9, 12, 18, 24, 36, 48, and 54 Mbps, or all
- 802.11an-mcs valid rates are MCS 0, MCS 1, MCS 2, MCS 3, MCS 4, MCS 5, MCS 6, MCS 7, MCS 8, MCS 9, MCS 10, MCS 11, MCS 12, MCS 13, MCS 14, MCS 15, or all
- 802.11bgn-mcs valid rates are MCS 0, MCS 1, MCS 2, MCS 3, MCS 4, MCS 5, MCS 6, MCS 7, MCS 8, MCS 9, MCS 10, MCS 11, MCS 12, MCS 13, MCS 14, MCS 15, or all

All base rates must be entered as supported rates.

Note: Changing the base rate in an ESS profile will cause all clients on all ESSIDs to reassociate.

The supported data rates are the rates supported by the access points. The basic data rates are a subset of the supported rates. The access point first tries to transmit at the highest data rate set to Basic. If there are problems encountered in the transmission, the access points steps down to the highest rate that allows data transmission.

Use the **base-tx-rates** command in ESSID configuration mode to configure the basic data rates, for example, for 802.11bg:

```
controller(config-essid)# base-tx-rates 802.11bg
   1|2|5.5|11|9|12|18|24|36|48|54|all
```

Use the **supported-tx-rates** command in ESSID configuration mode to configure the supported transmit rates, for example, for 802.11bg:

```
controller(config-essid)# supported-tx-rates 802.11bg
   1|2|5.5|11|9|12|18|24|36|48|54|all
```

To remove a base transmit rate, use the **no base-tx-rates** command with the mode and speed value, for example, for 802.11bg:

```
controller(config-essid)# no base-tx-rates 802.11bg
   1|2|5.5|11|9|12|18|24|36|48|54|all
```

To remove a supported transmit rate, use the **no supported-tx-rates** command with the mode and speed value, for example, for 802.11bg:

```
controller(config-essid)# no supported-tx-rates 802.11bg
   1|2|5.5|11|9|12|18|24|36|48|54|all
```

To display the radio data rates, use the **show essid** command.

Assigning a VLAN with the CLI

When creating an ESSID, you can assign a VLAN to the ESSID. This allows you isolate an ESSID to a specific part of your network. By default, ESSIDs do not have VLANs assigned to them. You must create a VLAN using the **vlan** command in global configuration mode *before* assigning the VLAN to an ESSID.

The following example assigns a vlan named *corp*:

```
controller(config-essid)# vlan corp
```

 © 2012 Meru Networks, Inc.

```
controller(config-essid)#
```

To remove a VLAN assignment from an ESSID, use the **no vlan** *name* command. The following example removes the VLAN assignment from the ESSID:

```
controller(config-essid)# no vlan corp
controller(config-essid)#
```

WMM Features Supported by System Director

In general, WMM contains these features:

- WMM (for QoS)
- WMM PS (U-APSD) - helps with battery life
- WMM AC (TSPEC) - admission control

System Director supports WMM packet tagging for QoS on AP300, AP400, and AP1000 automatically (if the client is WMM); this feature cannot be turned off. System Director supports U-APSD on AP300/AP400/AP1000; this can be turned on and off. System Director does not support WMM AC (TSPEC).

U-APSD is ideally suited to mobile devices that require advanced power-save mechanisms for extended battery life, and for applications like VoIP where the user experience rapidly degrades as latency increases. WMM Power Save was designed for mobile and cordless phones that support VoIP. See the chart below for defaults and possible configurations of both the WMM QoS and WMM APSD features.

WMM-PS is an enhancement over the legacy power-save mechanisms supported by Wi-Fi networks. It allows devices to spend more time in a “dozing” state, which consumes less power, while improving performance by minimizing transmission latency. Furthermore, U-APSD promotes more efficient and flexible over-the-air transmission and power management by enabling individual applications to control capacity and latency requirements.

Note: If a deployment utilizing AP1000 models has WMM or WMM-APSD VoIP phones in use with DSCP set to Expedited Forwarding, a special QoS rule must be configured to support the deployment. This rule must have a DSCP parameter value of CS6 or CS7 in order to ensure that the AP1000 queues packets properly, ensuring optimal call quality.

U-APSD capable stations download frames buffered from AP300/AP400/AP1000s during unscheduled Service Periods (SP); the result is that there is no wait for beacons as there is in the legacy method. For U-APSD capable stations, APs negotiate U-APSD and use it to transmit data for the WMM Access Categories (priority levels) negotiated for U-APSD when a station is in power save mode. When a device is in power-save mode, the uplink data frame triggers AP300/AP400/AP1000 to send frames buffered in U-APSD enabled WMM_AC-queues. Pending legacy mode frames are not transmitted. You can configure AP300/AP400/AP1000 U-APSD support from

© 2012 Meru Networks, Inc.

the CLI using the ESSID command **apsdsupport** or you can configure APSD support for an ESSID from the Web UI (**Configuration > Wireless > ESSID** and then turn on **U-APSD**).

Configure U-APSD

APSD settings are configured per ESS and APSD support is on by default; this setting only affects AP300/AP400/AP1000. To configure APSD from the Web UI, click **Configuration > Wireless > ESS >** select an ESS from the list **>** set APSD Support to **on**.

To turn on/off APSD support with the CLI, use the command **apsd-support** for the ESSID as shown in this example:

```
default# configure terminal
default(config)# essid apsd
default(config-essid)# no apsd-support
default(config-essid)# end
```

Virtual Cell Overflow Feature

If you are using AP300/AP400 models, you can now temporarily expand the capacity of a Virtual Cell for peak usage times or areas. This feature, called Vcell Overflow, works by pairing a Virtual Cell ESS with a non-Virtual Cell ESS. The overflow ESS automatically inherits the parameters of the Virtual Cell ESS (except the setting for Virtual Cell). The non-Virtual Cell ESS is not used unless the Virtual Cell ESS is maxed-out; when this happens, the Virtual Cell ESS overflows into the other ESS as needed. The two ESS Profiles share an SSID so that clients seamlessly move back and forth. The overflow decision is based on the percentage of airtime spent on beacons crossing a threshold; when the percentage reaches 50%, clients start to overflow.

When Would I Use Virtual Cell Overflow?

This feature is designed for a high density deployment and provides a solution for bottlenecks caused by transmitting beacons. Virtual Cell Overflow is useful in these situations:

- Beacon overhead has become very high due to the legacy b devices.
- A very dense network is consuming a lot of airtime with beacons.
- For whatever reason, you Virtual Cell and non-Virtual Cell must co-exist on AP300/AP400. For example, some phones' best practices recommend non-Virtual Cell, and it's OK to have low bandwidth on these phones.

Be aware that Virtual Cell Overflow has these tradeoffs:

- Trade-off between mobility and performance
- Trade-off between density and performance
- Not a solution to get good performance for overflow clients

 © 2012 Meru Networks, Inc.

Configure Virtual Cell Overflow with the Web UI

To set up Virtual Cell Overflow from the Web UI, follow these steps:

1. Create a Virtual Cell ESS by following the directions **Add an ESS with the Web UI**. Be sure that the setting for Virtual Cell is set to **On**.
2. Create a non-Virtual Cell ESS by following the directions **Add an ESS with the Web UI**. Be sure that the setting for Virtual Cell is set to **Off**. Make this an Overflow ESS with the setting **Overflow for**; select the ESS you created in Step 1. This overflow ESS automatically inherits the remaining parameters of the Virtual Cell ESS.

Configure Virtual Cell Overflow with the CLI

In the CLI, a new command, **overflowfrom-essprofile**, has been added for this purpose. See the example below.

```
default(0)# show essid
ESS Profile Name              SSID                          Security Profile
   Broadcast  Tunnel Interface Type
vcelloverflow                 vcelloverflow                  default
   on         none
        ESS Profile(1 entry)
default(0)# configure terminal
default(0)(config)# essid vcelloverflowoss
default(0)(config-essid)# overflowfrom-essprofile vcelloverflow
default(0)(config-essid)# end
default(0)# show essid
ESS Profile Name              SSID                          Security Profile
   Broadcast  Tunnel Interface Type
vcelloverflow                 vcelloverflow                  default
   on         none
vcelloverflowoss              vcelloverflow                  default
   on         none
        ESS Profile(2)
default(0)# show essid vcelloverflowoss
ESS Profile

ESS Profile Name                          : vcelloverflowoss
SSID                                      : vcelloverflow
Security Profile Name                     : default
Primary RADIUS Accounting Server          :
Secondary RADIUS Accounting Server        :
Accounting Interim Interval (seconds)     : 3600
Beacon Interval (msec)                    : 100
SSID Broadcast                            : on
Bridging                                  : none
New AP's Join ESS                         : on
Tunnel Interface Type                     : none
VLAN Name                                 :
GRE Tunnel Profile Name                   :
Allow Multicast Flag                      : off
Silent Client Polling                     : off
Virtual Cell                              : off (because this is the overflow ESS)
```

```
Virtual Port                              : off
Overflow for                              : vcell_ESS
WMM Support                               : off
APSD Support                              : off
DTIM Period (number of beacons)           : 1
Dataplane Mode                            : tunneled
AP VLAN Tag                               : 0
AP VLAN Priority                          : off
Countermeasure                            : on
Multicast MAC Transparency                : off
Band Steering Mode                        : disable
Band Steering Timeout(seconds)            : 5
```

Bridging Versus Tunneling

The bridged AP feature allows APs to be installed and managed at locations separated from the controller by a WAN or ISP, for example, in a satellite office. Encryption can be enabled on the bridged connection to provide security over ISP-based connections.

The controller, through a keep-alive signal, monitors the remote AP. Remote APs can exchange control information, including authentication and accounting information with the controller, but are unable to exchange data. (Remote bridged APs can, however, exchange data with other APs within their subnet.)

Supported Features for Bridged ESS Profiles

The features supported by bridged ESS profiles are:

- WMM QoS AP300/AP400
- AP300/AP400 and AP1000 support bridged ESS profiles with a static VLAN. AP150 supports bridged ESS profiles without VLAN tagging.
- Virtual Cell/Virtual Port (AP300/AP400, AP1000)
- 802.1X authentication (dynamic WEP, WPA, WPA2 or MIXED)
- Multiple ESSIDs
- All security modes/options except Captive Portal (both static and dynamic keying)
- RADIUS authentication and accounting ACL-based and RADIUS-based MAC filtering
- ACL-based and Radius-based MAC filtering
- Mapping IP DSCP or 802.1p to WMM Access Categories (AP300/AP400)

Because remote APs cannot exchange data-plane traffic (including DHCP) with the controller, certain Meru Wireless LAN features are not available for remote AP configurations. These include:

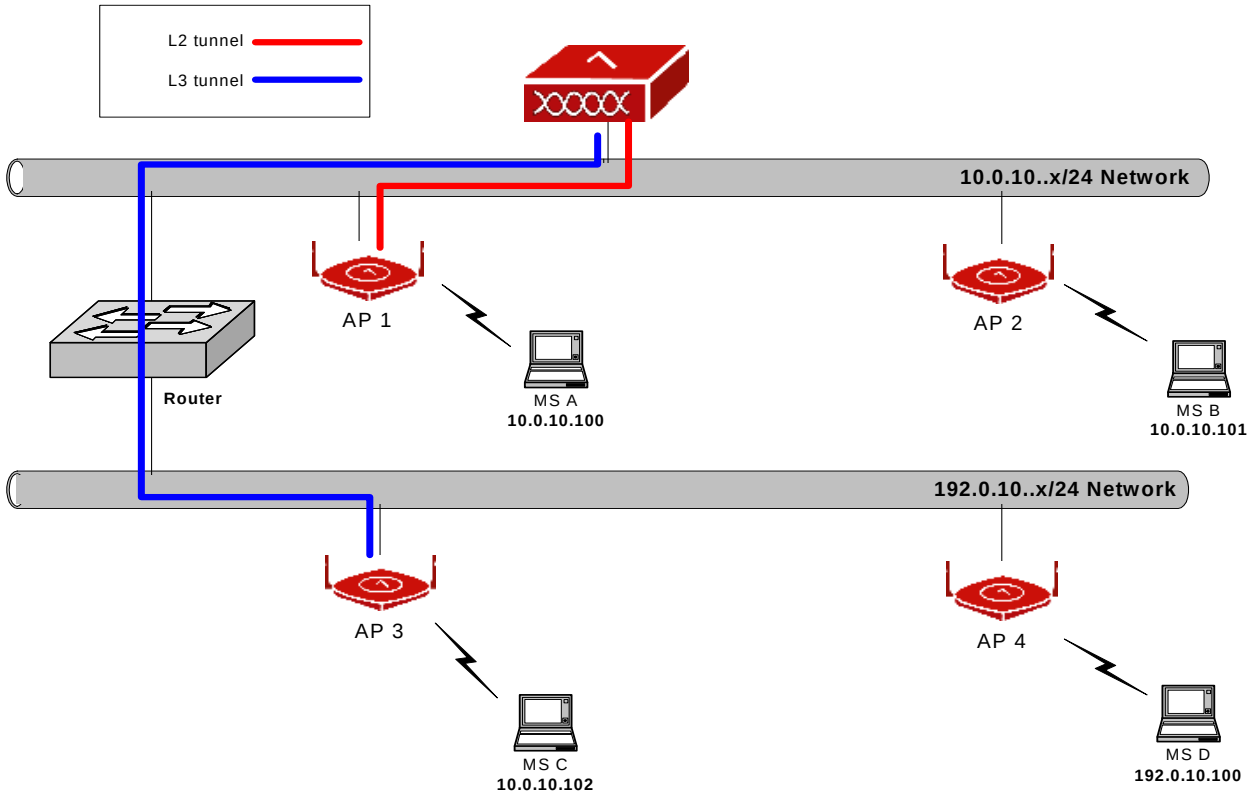
 © 2012 Meru Networks, Inc.

- QoS rules and firewall rules
- Dynamic Flow detection (for SIP/H.323)
- Captive Portal
- L3 mobility
- Radius-based VLAN assignment
- DHCP relay

Example of Bridged AP Deployment

The following figure is an example of remote bridged AP deployment. Notice that AP1 is configured for L2/local mode, AP2 is configured L2/Remote mode, AP3 is configured L3/local mode, and AP4 is configured for L3/Remote AP mode. The controller, AP1 and AP2 are located in the same 10.0.10.x/24 subnet, and AP3 and AP4 are in a different subnet, 192.0.10.x/24. The blue and red lines correspond to L2 and L3 data tunnel, respectively. Also, MS A through D are associated to AP 1 to 4, respectively. Note that the MS C and MS D have different IP addresses, even though they are associated to APs within the same IP subnet. The reason for this is because AP3 is configured in local mode and is tunneled back to the controller at Layer 3. This example demonstrates how a mobile client's IP domain is changed by the dataplane bridged or tunneled setting.

Figure 8: Example Remote AP Topology



© 2012 Meru Networks, Inc.

Configure a Bridged AP

For complete UI directions, see **Add an ESS with the Web UI** or click **Configuration > Wireless > ESS** and select an ESS to edit.

To configure a bridged AP for an existing ESSID with the CLI, follow these steps:

1. Enter the ESSID configuration mode and set the dataplane mode to bridged:

```
controller# configure terminal
controller(config)# essid profile_name
controller(config-ap)# dataplane bridged
controller(config-ap)# exit
```

After you make the config changes, force the APs to do a hard reboot.

2. If the connection between the controller and the Remote AP should be secured, use the following command to encrypt only an AP150 connection:

```
controller# configure terminal
controller(config)# ap ap#
controller(config-ap)# dataplane-encryption on
controller(config-ap)# exit
```

The Remote AP feature may require that corporate firewall configuration be updated to permit wireless access over certain Ethernet ports. The affected ports are:

- L2 (Ethernet) L3 (UDP)
- Data 0x4000 9393
- Comm 0x4001 5000
- Discovery 0x4003 9292

When a Bridged AP Loses Controller Contact

When a bridged AP loses contact with its host controller, it continues to function for up to two days, depending on controller's the setting for Link Probing (1 minute - 32000 minutes). During this time, clients that were connected when the controller went down function normally, but they cannot switch APs. Also, new clients cannot join a bridged AP during this time.

Multicasting Feature

Multicasting is a technique frequently used for the delivery of streaming media, such as video, to a group of destinations simultaneously. Instead of sending a copy of the stream to each client, clients share one copy of the information, reducing the load

 © 2012 Meru Networks, Inc.

on the network. Multicasting is an advanced feature and can cause subtle changes in your network. By default, multicasting is disabled and should be enabled only for specific circumstances. Possible multicasting applications include:

- Broadcast via cable or satellite to IPTV (for example, Vbrick or Video Furnace)
- Any broadcast application (for example, CEO address to company)
- Distance learning (live lectures)
- Video surveillance
- Video conferencing

For multicast to work, you need to complete these four tasks:

- Enable Virtual Cell and Virtual Port on AP300/AP400s - see **Configuring Virtual Cell Support for AP300 or AP400 with the CLI** and **Virtual Port is Now Part of Virtual Cell** for directions.
- Enable IGMP snooping on the controller - see **Configuring IGMP Snooping on Controllers and APs**
- Enable IGMP snooping on the network infrastructure including intermediary switches. You must do this because Meru controllers do not source multicast group membership queries. We rely (as do most controllers) on the switches to perform that task.
- Map a Virtual Cell enabled ESS with the default VLAN - see **Assigning a VLAN with the CLI**.

Configuring IGMP Snooping on Controllers and APs

Multicasting is implemented using IGMP snooping. In System Director release 3.6, IGMP snooping was only done at the controller; the controller knew which clients were subscribed to specific multicast streams and sent the data for the subscribed multicast stream only to the APs with clients currently being serviced. Since the AP didn't know which clients subscribed to the specific stream, it would send multicast streams to all clients currently being serviced by the AP. (With Virtual Port, there would be N copies, one for each client). This wasted airtime and created unnecessary traffic and contention.

In release 4.0 and later, IGMP snooping is done not only by the controller but also done by AP300/AP400s (excluding AP1000) when using Virtual Cell. The controller passes the client subscription list for multicast streams to AP300/AP400, which limits the multicast streams to only subscribed clients, reducing wireless traffic and saving time. (There are no changes in sending multicasts for stations connected to non-Virtual Cell ESS profiles.)

Commands to Configure IGMP Snooping

The following command is used to enable/disable IGMP snooping on the controller and APs:
igmp-snoop state [enable, disable]

Command to show igmp-snoop status:
show igmp-snoop

© 2012 Meru Networks, Inc.

Command to see which multicast groups are currently active:
show igmp-snoop forwarding-table

Command to see which stations have joined multicast groups:
show igmp-snoop subscription-table

Multicast MAC Transparency Feature

This feature enables MAC transparency for tunneled multicast, which is needed for some clients to receive multicast packets. Multicasting is an advanced feature and can cause subtle changes in your network. By default, multicasting is disabled. To enable it, use either the **multicast-enable** command (see example below) or **Configuration > Wireless > ESS > Add** in the Web UI (see example below).

Caution! Multicasting is an advanced feature. Enabling multicasting in the WLAN can cause subtle changes in your network. Contact Meru Networks Customer Service Technical Assistance Center before enabling multicasting.

Enable Multicast From the Web UI

To enable multicasting from the Web UI, add or modify an ESS. For directions, see **Add an ESS with the Web UI**.

Enable Multicast with the CLI

The following example enables multicasting with the CLI:

```
controller(config-essid)# multicast-enable
```

For command details, see the *Meru System Director Command Reference*.

View Mapping Between VLANs and ESS Profiles

Use the following command to see the VLANs and ESS profiles currently mapped:

```
controller(config-essid)# show vlan ess-profile
```

For command details, see the *Meru System Director Command Reference*.

Bridging with AirFortress and AppleTalk

Wireless bridging with Fortress Technology AirFortress gateway and AppleTalk networks can be configured to extend ESSID functionality.

FortressTech Layer 2 Bridging

FortressTech Layer 2 bridging and encryption with Fortress Technology AirFortress gateway allows an administrator to configure FortressTech encryption on one or more ESSIDs.

From the essid configuration submode, use the commands **l2bridge airf** and **no l2bridge airf** to enable and disable this feature, respectively.

AppleTalk Layer 2 Bridging

This feature allows an administrator to configure bridging to AppleTalk networks on one or more ESSIDs. From the essid configuration sub mode, use the commands **l2bridge appletalk** and **no l2bridge appletalk** to enable and disable AppleTalk bridging, respectively.

Note: If more than one ESSID profile is active on the controller, AppleTalk clients are not able to find an enabled AppleTalk printer. This does not occur when only one ESSID is active.

GRE ESSID Feature

The ESSID configuration for GRE tunneling is described in chapter Chapter 12, “Configuring VLANs.”

Band Steering Feature

Band steering works with multi-band capable clients by letting you assign bands to clients based on their capabilities. Without band steering, an ABG client could formerly associate on either the A or the B/G channels, leading to overcrowding on one band or the other. With band steering, you can direct some of this traffic to the A band. Another example of using band steering is to separate voice and data traffic.

© 2012 Meru Networks, Inc.

You can leave all voice-capable clients the B/G channels (where bandwidth is not a concern) and move data-only clients to the A bands to achieve higher data rates. To use band steering for ABGN traffic, you could use A-Steering to direct dual mode clients with A capability to the 5GHz band and use N-Steering to direct all dual mode clients with AN capability to the 5GHz band. Band steering is also useful for directing multicast traffic.

Configure Band Steering with the Web UI

Band Steering is enabled on a per-ESS basis. When you create or modify an ESS, you can enable band steering. To do this with the Web UI, follow the directions **Add an ESS with the Web UI** setting the field Enable Band Steering to **On**. The field Band Steering Timeout defaults to 5 seconds; this is the number of seconds that assignment for a steered client is blocked on the forbidden band while it is unassociated. For this command to work as clients are added, also set the field New APs Join ESS to **on** in the ESS.

Configure Band Steering with the CLI

Two new CLI commands have been added for band steering. **band-steering-mode** enables band steering on an ESS and **band-steering-timeout** sets the number of seconds that assignment for a steered client is blocked on the forbidden band while it is unassociated. The command **band-steering-mode disable** turns off band steering. To use band steering, create an ESS with the following configuration:

```
New AP's Join ESS                          : on
Tunnel Interface Type                      : none
VLAN Name                                  :
GRE Tunnel Profile Name                    :
Allow Multicast Flag                       : off
Silent Client Polling                      : off
Enable Virtual Cell                        : on
WMM Support                                : off
DTIM Period (number of beacons)            : 1
Virtual Cell Type                          : shared-bssid
Dataplane Mode                             : bridged
B Supported Transmit Rates  (Mbps)         : 1,2,5.5,11
B Base Transmit Rates  (Mbps)              : 1,2,5.5,11
A Supported Transmit Rates (Mbps)          : 6,9,12,18,24,36,48,54
A Base Transmit Rates (Mbps)               : 6,12,24
G Supported Transmit Rates (Mbps)          : 6,9,12,18,24,36,48,54
G Base Transmit Rates (Mbps)               : 6,9,12,18,24,36,48,54
BG Supported Transmit Rates (Mbps)         :
   1,2,5.5,11,6,9,12,18,24,36,48,54
BG Base Transmit Rates (Mbps)              : 1,2,5.5,11
Enable Countermeasure                      : on
Packet Error Control                       : off
Packet Error Limit                         : 0
Rx Packet control                          : off
Rx Packet Limit                            : 0
Band Steering Mode                         : a-steering
```

 © 2012 Meru Networks, Inc.

```
Band Steering Timeout(seconds)           : 5
```

This example sets band steering to the A channel on the existing ESS named Bandsteeress:

```
default# configure terminal
default(config)# essid Bandsteeress
default(config-essid)# dataplane
default(config-essid)# dataplane bridged
default(config-essid)# band-steering-mode a-steering
default(config-essid)# end
default# sh essid Bandsteeress

ESS Profile Name                         : Bandsteeress
SSID                                     : Bandsteeress
Security Profile Name                    : default
Primary Radius Accounting Server         :
Secondary Radius Accounting Server       :
Accounting Interim Interval (seconds)    : 3600
Beacon Interval (msec)                   : 100
SSID Broadcast                           : on
Bridging                                 : none
New AP's Join ESS                        : on
Tunnel Interface Type                    : none
VLAN Name                                :
GRE Tunnel Profile Name                  :
Allow Multicast Flag                     : off
Silent Client Polling                    : off
Enable Virtual Cell                      : on
WMM Support                              : off
DTIM Period (number of beacons)          : 1
Virtual Cell Type                        : shared-bssid
Dataplane Mode                           : bridged
B Supported Transmit Rates  (Mbps)       : 1,2,5.5,11
B Base Transmit Rates  (Mbps)            : 1,2,5.5,11
A Supported Transmit Rates (Mbps)        : 6,9,12,18,24,36,48,54
A Base Transmit Rates (Mbps)             : 6,12,24
G Supported Transmit Rates (Mbps)        : 6,9,12,18,24,36,48,54
G Base Transmit Rates (Mbps)             : 6,9,12,18,24,36,48,54
BG Supported Transmit Rates (Mbps)       :
   1,2,5.5,11,6,9,12,18,24,36,48,54
BG Base Transmit Rates (Mbps)            : 1,2,5.5,11
Enable Countermeasure                    : on
Packet Error Control                     : off
Packet Error Limit                       : 0
Rx Packet control                        : off
Rx Packet Limit                          : 0
Band Steering Mode                       : a-steering
Band Steering Timeout(seconds)           : 5
```

This example disables band steering:

```
default# configure terminal
default(config)# essid Bandsteeress
default(config-essid)# band-steering-mode disable
default(config-essid)# end
default# sh essid Bandsteeress
```

```

Expedited Forward Override

The **Expedited Forward Override** option is implemented to override the system's default DSCP-to-WMM priority mapping. IP datagrams marked with DSCP Expedited Forwarding (46) will be sent from the WMM Voice queue (AC_VO) of the AP rather than the Video queue (AC_VI) in downstream (to stations). This feature is specific to AP300/AP400 and is disabled by Default. It is configured on a per-ESS Profile basis and works in both bridged and tunneled ESS profiles.

Steps to configure Expedited Forward Override

1. Steps to Enable Expedited Forward Override Feature in ESSID:

```
Meru # config terminal
Meru(config)# essid meru
Meru(config-essid)# expedited-forward-override
```

 © 2012 Meru Networks, Inc.

```
Meru(config-essid)# end
Meru# show essid meru
```

ESS Profile

```
ESS Profile Name                          : meru

SSID Broadcast for Vport

The SSID Broadcast for Vport function is designed to improve connectivity when using Cisco phones.

Configuration of SSID Broadcast for Vport

The **SSID Broadcast for Vport** option is similar to that for the ESSID configuration parameter. From the ESSID configuration, the SSID Broadcast for Vport option has three configurable parameters from GUI and IOSCLI as follows:

1. **Disable**: This is the default configuration on the ESSID profile page. Configuring the parameter to “Disable” makes the AP not to advertise the SSID in the beacon.
   Example for configuring the option to Disable from IOSCLI:

```
default# configure terminal
default(config)# essid assign
default(config-essid)# publish-essid-vport disabled
default(config-essid)# exit
default(config)# exit
```

2. **Always**: Configuring the parameter to “Always” enables the AP to advertise the SSID on the beacons always. This must not be configured unless recommended.
   Example for configuring the option to till association from IOSCLI:

```
default# conf terminal
default(config)# essid assign
default(config-essid)# publish-essid-vport always
default(config-essid)# end
```

3. **Till-Association**: Configuring the parameter to “Till-Association” enables the AP to advertise the SSID in the beacons until the association stage of the client and disables the SSID broadcast in the later part of connectivity. This parameter is preferable to configure for the certain version of phones which will resolves the connectivity issues with the Vport ON. Once station associated, AP320 will stop broadcasting SSID string. Here the users are allowed to configure SSID broadcast for VPort parameter from controller GUI per ESS basis in addition to AP CLI.

© 2012 Meru Networks, Inc.

Example for configuring the option to till association from IOSCLI:

```
default# conf terminal
default(config)# essid assign
default(config-essid)# publish-essid-vport till-association
default(config-essid)# end
```

Multiple ESSID Mapping

The following configuration example shows how to create three ESSIDs and map them to three different VLANs to separate guest users, corporate users, and retail traffic.

The first ESSID, guest-users, is mapped to a VLAN named *guest*. This ESSID is configured to use the default security profile, which requires no authentication method or encryption method. The VLAN IP address is 10.1.1.2/24 with a default gateway of 10.1.1.1. The DHCP server IP address is 10.1.1.254. This ESSID is configured so that it is added to each access point automatically and is also part of a Virtual Cell. (All access points on the same channel with this ESSID share the same BSSID.)

The second ESSID, corp-users, is mapped to a VLAN named *corp*. This ESSID is configured to use a security profile called corp-access, which requires 64-bit WEP for an authentication/encryption method. The static WEP key is set to *corp1*. The VLAN IP address is 10.1.2.2/24 with a default gateway of 10.1.2.1. The DHCP server IP address is 10.1.2.254. This ESSID is configured so that it is added to each AP automatically and is also part of a Virtual Cell.

The third ESSID, retail-users, is mapped to a VLAN named *retail*. This ESSID is configured to use a security profile called retail-access, which requires 802.1X as an authentication method. The 802.1X rekey period is set to 1000 seconds. The primary Radius server IP address is set to 10.1.3.200, the primary Radius port is set to 1812, and the primary Radius secret is set to *secure-retail*. The VLAN IP address is set to 10.1.3.2/24 with a default gateway of 10.1.3.1. The DHCP server IP address is 10.1.3.254. This ESSID is configured so that it is added to the access point with node id 1 only. Also, the broadcasting of this ESSID value in the beacons from the access point is disabled, and the ESS is given a BSSID of 00:0c:e6:02:7c:84.

Use the **show vlan** command to verify the VLAN configuration:

```
controller# show vlan
VLAN Configuration
VLAN Name   Tag  IP Address      NetMask          Default Gateway
guest       1    10.1.1.2        255.255.255.0    10.1.1.1
corp        2    10.1.2.2        255.255.255.0    10.1.2.1
retail      3    10.1.3.2        255.255.255.0    10.1.3.1
```

Now that the VLANs and security profiles have been created, the new ESSIDs can be created and configured.

 © 2012 Meru Networks, Inc.

```
controller# configure terminal
controller(config)# essid guest-users
controller(config-essid)# security-profile default
controller(config-essid)# vlan guest
controller(config-essid)# exit
controller(config)# essid corp-users
controller(config-essid)# security-profile corp-access
controller(config-essid)# vlan corp
controller(config-essid)# exit
controller(config)# essid retail-users
controller(config-essid)# security-profile retail-access
controller(config-essid)# vlan retail
controller(config-essid)# no ap-discovery join-ess
controller(config-essid)# no publish-essid
controller(config-essid)# ess-ap 1 1
controller(config-essid-ess-ap)# bssid 00:0c:e6:03:f9:a4
controller(config-essid-ess-ap)# exit
controller(config-essid)# exit
controller(config)# exit
controller#
```

To verify the creation of the new ESSIDs, use the **show essid** command.

To view detailed configuration for each of the new ESSIDs, use the **show essid** *essid-name* command.

To verify that the *guest-users* and *corp-users* ESSIDs were automatically joined to both access points connected to the controller and that the *retail-users* ESSID was only joined to AP 1, use the **show ess-ap ap** *ap-node-id* or the **show ess-ap essid** *essid-name* commands.

```
controller# show ess-ap ap 1
ESS-AP Configuration
AP ID: 1
ESSID                   AP Name        Channel  BSSID
guest-users             AP-1            6       00:0c:e6:01:d5:c1
corp-users              AP-1            6       00:0c:e6:02:eb:b5
retail-users            AP-1            6       00:0c:e6:03:f9:a4

controller# show ess-ap ap 2
ESS-AP Configuration
AP ID: 2
ESSID                   AP Name        Channel  BSSID
guest-users             AP-2            6       00:0c:e6:01:d5:c1
corp-users              AP-2            6       00:0c:e6:02:eb:b5
controller# show ess-ap essid retail-users
ESS-AP Configuration

Bridged AP300 in a Remote Location

When bridged mode is configured in an ESSID, an AP using that ESSID can be installed and managed at a location separated from the controller by a WAN or ISP, for example at a satellite office. The controller monitors remote APs with a keep-alive signal. Remote APs exchange control information, including authentication and accounting information, with the controller but cannot exchange data. Remote APs exchange data with other APs within their subnet.

Because Remote APs cannot exchange data-plane traffic (including DHCP) with the controller, certain Meru Wireless LAN features are not available for remote AP configurations. These include:

- QoS
- Captive Portal
- L3 mobility

The features that are available are:

- VLAN
- Virtual Cell
- 802.1X authentication
- High user density
- Multiple ESSIDs
- Dataplane encryption for backhoe on L3 tunnel with AP150s

Configure Bridged Mode with the Web UI

Configure bridged mode when you add or modify an ESS with the Web UI; for directions, see **Add an ESS with the Web UI**.

Configure Bridged Mode with the CLI

This example creates the ESSID abcjk, sets its mode to bridged, assigns a tag, and then gives top priority to abcjk.

```
test (config-essid)#
test# configure terminal
test (config)# essid abcjk
test (config-essid)# dataplane bridged
test (config-essid)# ap-vlan-tag 11
test (config-essid)# ap-vlan-priority
test (config-essid)# end
```

For details of the commands used here, see the *Command Reference Guide*.

 © 2012 Meru Networks, Inc.

Utilizing Multiple IPs on a Single MAC

In current Meru implementations, a typical client machine (or station) is granted a single IP Address per wireless adapter in use. However, with the growing use of Virtual Machine models (provided by VMware, Parallels, etc.), a single station can run multiple Operating Systems from a single client. With this release of Meru System Director, each Virtual Machine can now be provided with an individual IP Address, making it much easier to troubleshoot packet transmissions.

To support this function, the System Director ESS Profile screen has a new function labeled MIPS, which is disabled by default. With this function enabled, packets are bridged across from the “host”, or main, Operating System to the “guest”, or virtual, system(s) as needed. The following notes apply:

- All data packets sent from the client will have the host OS MAC address as their source address.
- All data packets sent to the client will have the host OS MAC address as their destination address.
- Each OS has a different client hardware address that is transmitted as part of the DHCP payload.
- “Guest” OS hardware devices have MAC addresses that start “00:0c:29”; this is the global standard OUI for VMware. This hardware address is used by the DHCP server to identify guest OSes, allowing them to be provided separate IP addresses.
- Grat ARP packets transmitted by any IP will have their corresponding unique client hardware addresses.
- All broadcast packets received by the host OS will also be delivered to the guest OS(es).
- All unicast packets received by the host OS will be delivered to the guest OS(es) based on the packets’ destination IP address.

In order to support this capability, a command has been added to the CLI:

- **show station multiple-ip**—Displays all IP addresses provided by each individual station along with MAC addresses (labeled ‘vmac’ for virtual devices). Note that for the host device, the Client MAC and Virtual MAC will be identical.

Note:

- Only IPv4 address types are supported.
- All IP addresses belonging to a single station are assumed to be part of the same VLAN.
- IP addresses provided to Virtual OSes are always dynamic; static addresses are not supported.
- ICR is not supported when this feature is enabled.

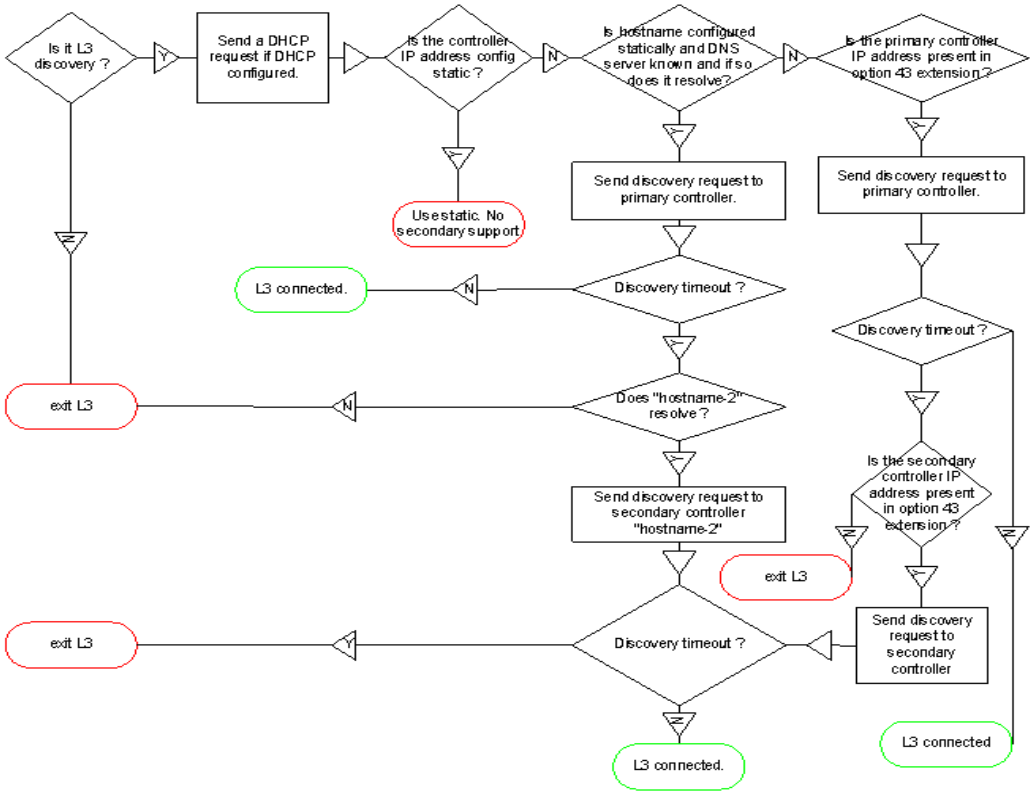
Chapter 6
Implementing Redundancy

There are three options available for controller redundancy:

- **Redundant Ethernet:** With this Ethernet link level redundancy, if one Ethernet link goes down, another Ethernet link on the same controller will take over.
- **N+1:** With this controller level redundancy, if one controller goes down, a designated slave controller will take over for the failed master controller.
- **Option 43:** With this controller level redundancy, an AP is aware of both the primary and secondary controller. If the primary controller goes down, the APs automatically associate with the secondary controller. If the primary controller comes back up, they associate to the primary controller.

Figure 9: Meru System Director Redundancy Flow



Is it L3 discovery ?
Y
Send a DHCP request if DHCP configured.
Is the controller IP address config static ?
N
Is hostname configured statically and DNS server known and if so does it resolve?
N
Is the primary controller IP address present in option 43 extension ?
Y
Send discovery request to primary controller.
Send discovery request to primary controller.
Use static. No secondary support
L3 connected.
N
Discovery timeout ?
Discovery timeout ?
exit L3
N
Does "hostname-2" resolve ?
Y
Send discovery request to secondary controller "hostname-2"
Is the secondary controller IP address present in option 43 extension ?
exit L3
Send discovery request to secondary controller
exit L3
Y
Discovery timeout ?
L3 connected
L3 connected.

For any redundancy option to work without issues, make sure that the VLANs are the same across all the ports on the external manageable switch.

With N+1, the backup controller must be in the same subnet as the primary controllers. With DHCP Option 43, you can specify a primary and backup controllers for the APs and with this configuration, the backup controller can be in a different subnet from the primary controller.

This chapter contains the following sections:

- **Configure Redundant Ethernet Failover With the CLI**
- **N+1 Redundancy**
- **Option 43**

Redundant Ethernet

When operating an MC1500 or MC3000, Ethernet redundancy can be enabled at any time by simply following the steps outlined in the following sections. However, some controller models require dual port bonding to be enabled before Ethernet redundancy can be activated. These controllers include the following models:

- MC3200
- MC4100
- MC4200
- MC5000 (with accelerator card)

To enable dual bonding on these models, access the controller's CLI and enter the following commands:

```
default# configure terminal
default(config)# bonding dual
default(config)# exit
default(config)# copy running-config startup-config
```

Note: MC6000 deployments require that bonding be set to **none** for Dual Ethernet redundant and Active configuration functionality.

The system requires a reboot for the change to become effective. Reboot the system now and then proceed with the following sections to enable redundancy.

 © 2012 Meru Networks, Inc.

Configure Redundant Ethernet Failover With the CLI

The following commands configure Ethernet interface 2 on a controller as a backup to Ethernet interface 1. Do this by issuing the option **redundant** for the **type** command as shown below.

```
default# configure terminal
default(config)# interface FastEthernet 2
default(config-if-FastEth)# type redundant
default(config-if-FastEth)# exit
default(config)# exit
default(config)# copy running-config startup-config
```

Note: In the redundant configuration, the IP address for the second Ethernet interface cannot be configured. It will receive the IP address of the primary Ethernet interface when the failover occurs.

The system requires a reboot for the change to become effective. Reboot the system now, and then check the redundant second interface configuration with the **show second_interface_status** command:

```
default# show second_interface_status
```

Recovering From Redundant Ethernet Failover

Once Dual Ethernet Redundant mode configuration is complete, the controller needs to be rebooted - see directions above. After the reboot, if the first Ethernet interface link goes down, then the second Ethernet interface takes over the controller connectivity. Redundant Ethernet failover is based on LinkID and does not require any spanning-tree configuration. When a LinkID is missing, the failover will occur in under one second. This failover will be transparent to the access points. The second interface remains active and serving all APs, even if the first interface comes up again. Verify this with the CLI command **show second-interface-status**. Only when the second interface goes down will the first interface (if it is up) take over the controller connectivity.

When N+1 or L3 redundancy is also configured and controller 1 fails, the APs move to controller 2. When controller 1 comes back online, the APs immediately begin to move back to controller 2. Also see **Recovering From N+1 with Dual Ethernet Failover**.

N+1 Redundancy

The optional N+1 redundancy software feature, when implemented, allows a standby N+1 slave controller in the same subnet to monitor and failover more than one master controller.

© 2012 Meru Networks, Inc.

A set of master controllers and a standby slave controller are configured via static IP addressing to reside in the same subnet, and are considered to be an N+1 cluster. The standby slave monitors the availability of the master controllers in the cluster by receiving advertisement messages sent by the masters over a well known UDP port at expected intervals. If five successive advertisements are not received, the standby slave changes state to an active slave, assumes the IP address of the failed master, and takes over operations for the failed master. Because the standby slave already has a copy of the master's latest saved configuration, all configured services continue with a short pause while the slave switches from standby to active state.

While in the active slave role, the slave controller's cluster monitoring activities are put on hold until the failed master rejoins the cluster. An active Slave detects the restart of a master through ARP. When the active slave is aware of the master's return (via the advertisement message) it relinquishes the master's IP address and then returns to the standby state. The now-passive slave will not fail over for the same master until a WTR is completed.

If it is necessary for the failed master to be off-line for a lengthy interval, the administrator can manually set the active slave back to the standby slave, thereby ensuring the standby slave is able to failover for another master.

In most cases with a cluster of N+1 Masters, the APs all have to be in L3 Connectivity mode, but if you only have one Master and one Slave unit (N=1) the APs can be in L2 connectivity mode. In this case, while the Master unit is active the Slave unit will not take AP registration so the AP will always go to the correct controller.

 © 2012 Meru Networks, Inc.

N+1 with Non-Revertive Mode

Previously, N+1 feature was incapable of providing an option to control the failback operation. This means, an active slave relinquishes a master's role as soon as the master becomes operational. The service downtime is doubled, when the fail over and fall back happens without the administrator's control. To control the fail back operation a Non-Revertive feature is introduced.

The Non-Revertive feature enables the administrator to choose when an active slave can relinquish a master's role. Apparently, an active slave verifies if the master is ready to take over the master's role or not. If the master is not ready, the failback operation fails to start, and active slave keeps operating as a master. While the active slave keeps operational, the master stays in the standby mode, waiting for the active slave to relinquish the role.

Here, the Administrator minds the failback operation. To control the failback operation, a non-revertive mode must be enabled. The failback operation can be scheduled at a desired date and time. A Revert can also be scheduled exclusively on the Active slave. Once this is performed, the Active slave reverts back to Passive at the time scheduled by the administrator. In another way, Active to Passive slave revert is performed forcibly without scheduling it on the Active Slave.

See **“Managing the N+1 Installation” on page 100** to configure the non-revertive mode and to schedule the revert.

Preparing the Network

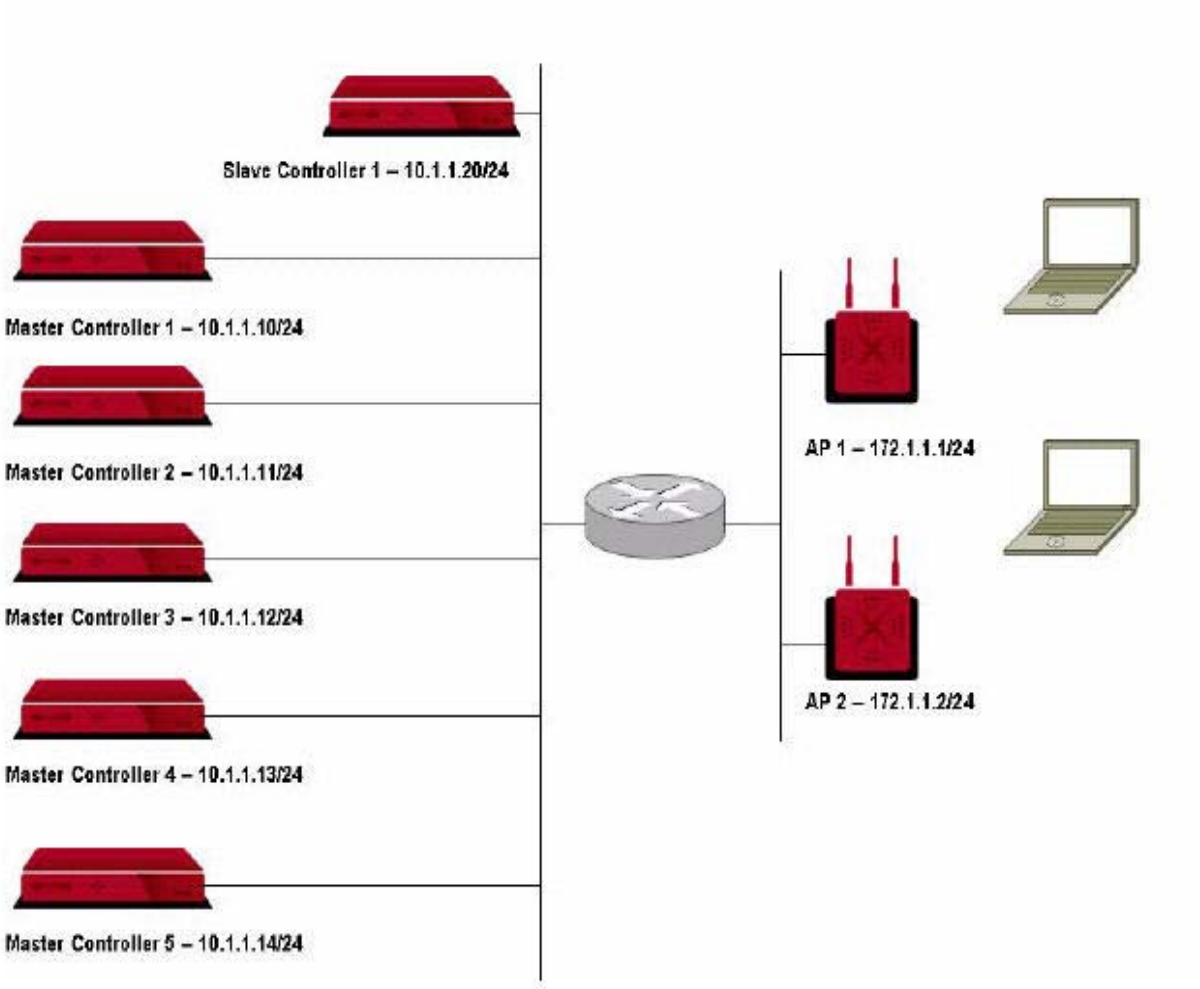
The N+1 cluster must be configured within a set of guidelines to operate as described in the previous section. While configuring your network for N+1 redundancy, the following guidelines must be followed:

- In the N+1 cluster, the slave and master controllers must be the same model and run the same version of System Director software. A check is performed by the slave controller after each master controller is assigned to it to ensure the hardware model and System Director version are identical; if a mismatch occurs, the slave is not allowed to switch over for this master, and that status is noted in the Status display for the Master Controller.
- All master and slave controllers must use static IP addressing to ensure consistency and control of N+1 clustering. (DHCP addresses are not supported for controllers participating in the N+1 cluster).
- Master and slave controllers must be on the same IP subnet.
- All APs in the network should be configured for Layer 3 connectivity with the controller.
- Spanning tree should be disabled on the switch port to which the controllers are connected. To disable spanning tree on the port, refer to your switch configuration documentation.

Configuring the N+1 Clusters shows a simplified network diagram of a recommended N+1 deployment.

© 2012 Meru Networks, Inc.

Figure 10: Example N+1 Redundancy Network Deployment



Slave Controller 1 – 10.1.1.20/24
Master Controller 1 – 10.1.1.10/24
Master Controller 2 – 10.1.1.11/24
Master Controller 3 – 10.1.1.12/24
Master Controller 4 – 10.1.1.13/24
Master Controller 5 – 10.1.1.14/24
AP 1 – 172.1.1.1/24
AP 2 – 172.1.1.2/24

Configuring the N+1 Clusters

This can only be configured using the CLI and up to five masters and one slave. You will need passwords for all controllers involved in the N+1 configuration. A summary of the steps to configure and start N+1 follows:

Step	Command	Description
1.	`nplus1 start master`	On each master, start N+1 redundancy.

 © 2012 Meru Networks, Inc.

Step	Command	Description
2.	**nplus1 start slave**	Start N+1on the slave controller.
3.	**nplus1 add** *master_hostname master_IP_address*	Add the master controller's hostname and IP address to the slave's cluster list.

Starting N+1 on Master Controllers

N+1 must first be started on the Master Controllers.

To configure a master controller:

1. On each master controller, enter configuration mode and start the N+1 software:

```
master# configure terminal
master(config)# nplus1 start master
```

2. Exit configuration mode and check that the N+1 software has been started on that controller:

```
master(config)# exit
master# sh nplus1
-----------------------------------------------------
       Master controller
       Master IP : 10.1.1.10
        Master Hostname : master
-----------------------------------------------------
```

Configuring N+1 on the Slave Controller

After starting N+1 on each of the Master Controllers, start N+1 on the Slave Controller, and then add each Master Controller to the Slave Controller.

Note: The Slave Controller must be the last controller in the cluster to start N+1. All Master Controllers must be added to the cluster before starting N+1 on the Slave Controller.

To configure N+1 on the slave controller, follow these steps:

1. Enter configuration mode and start the N+1 software:

```
slave# configure terminal
slave(config)# nplus1 start slave
Setting up this controller as a Passive Slave controller
3000-slave(config)#
```

© 2012 Meru Networks, Inc.

2. Check that the software has started on the slave with the **show nplus1** command (note that no masters display in the Master Controllers list):

```
Slave(config)# do show nplus1
The system is not fully operational

--------------------------------------------------------------------------------

slave(config)# do show nplus1

Current State : Passive
Non-Revertive mode : Disable
Wait to Restore (WTR) : 8 minutes
Master Timeout : 5 keepalives
Slave IP : 192.168.10.204
Slave Hostname : slave
License Type : Licensed
License Usage (Used/Tot) : 0/5

--------------------------------------------------------------------------------

Master Controllers
Missed
Hostname       IP Address  Admin    Switch  Reason           Adverts
SW Version

--------------------------------------------------------------------------------

Slave#
```

3. Supply the hostname and IP address of each master controller in the cluster. You will be prompted for the controller's password to complete the addition:

```
Slave# configure terminal
Slave(config)# nplus add ScaleMasterThree 10.1.1.10
admin@10.1.1.10 Password:
```

4. Exit configuration mode and check that the master controller has been enabled (the Admin status is now Enable):

```
  slave(config)# exit
  slave# show nplus1
-----------------------------------------------------------------------------------------------
            Current State : Passive
       Non-Revertive mode : Disable
    Wait to Restore (WTR) : 8 minutes
           Master Timeout : 5 keepalives
                Slave IP : 10.1.1.21
           Slave Hostname : Slave
             License Type : Licensed
 License Usage (Used/Tot) : 1/5
-----------------------------------------------------------------------------------------------
                       Master Controllers
                                                                      Missed   SW

```
    ScaleMasterThree   10.1.1.10    Enable   Yes     -               0        5.0-xx
```

Monitoring the N+1 Installation

The **show nplus1** command allows you to check the current controller configuration and show the status of the controller. Some sample output displays are included to show the information displayed in the various controller states.

- **N+1 on master**—displays basic master controller identification information

```
ScaleMasterThree# sh nplus1
-----------------------------------------------------
                Master controller
               Master IP : 10.1.1.10
          Master Hostname : ScaleMasterThree
-----------------------------------------------------
```

- **N+1 on a standby slave**—basic slave controller identification information plus the status for the master controllers in the cluster (accompanying table describes status fields)

```
Slave# sh nplus1
-------------------------------------------------------------------------
            Current State : Passive
       Non-Revertive mode : Disable
    Wait to Restore (WTR) : 8 minutes
           Master Timeout : 5 keepalives
                 Slave IP : 10.1.1.21
           Slave Hostname : Slave
             License Type : Licensed
 License Usage (Used/Tot) : 1/5
-------------------------------------------------------------------------
                      Master Controllers
                                                              Missed
            Hostname       IP Address  Admin    Switch  Reason           Adverts  SW
  Version
-------------------------------------------------------------------------
    ScaleMasterThree   10.1.1.10    Enable   Yes     -               0        5.0-xx
Slave#
```

The descriptions of the display fields are provided in the following table:

Field	Description
Hostname	Hostname of the master controller
IP Address	Static IP address assigned to the master controller
Admin	Status of N+1 redundancy on the master: • Enable—N+1 redundancy has been enabled on the master • Disable—N+1 redundancy has been disabled
Switch	Ability of the slave to assume active slave for the master: • Yes—Slave and master model/system director version number are compatible • No—Slave and master model/system director version number are incompatible or the administrator has disabled N+1 on the master

 © 2012 Meru Networks, Inc.

Field	Description
Reason	If Switch is No, describes why switch cannot be made: • Down: Master has been disabled by the user • SW Mismatch: The system director software is out of sync (update the Master Controller). • No Access: The Passive Slave was not able to access the Master because it did not receive a copy of the configuration. This is a rare message that occurs if **show nplus1** is executed almost immediately after adding a controller. • No Access: The Passive Slave was not able to access the Master Controller. This occurs most frequently if a replacement controller has not had access cleared using the **nplus1 access** command. • WTR Set: As an Active Slave transitions back to Passive Slave this state is the first step in the WTR timer countdown. • WTR—*Xs*: After the WTR Set is reached, the timer counts down, showing the number of seconds (*s*) remaining. • Suspected Up: If N+1 service is stopped on the Master when the controller is reachable via its IP, the Passive Slave transitions to Active Slave (due to missing N+1 keepalives from its master), becomes the Active Slave (with Master's IP address), now detects that the Master IP is reachable, and then transitions back to Passive Slave with the reason as Suspected up.
Adverts	Number of consecutively missed (not received) advertisements (a maximum of 5 triggers a failover if the Switch field is Yes).
SW Version	The software version of System Director on the controller.

- **N+1 on an active slave**—the master IP address and hostname are added to the display

```
3000-1# show nplus1
-------------------------------------------
        Current State : Active
        Non-Revertive mode : Disable
       Wait to Restore : 8 minutes
          Master IP : 10.1.1.10
       Master Hostname : 3000-1
              Slave IP : 10.1.1.21
        Slave Hostname : 3000-slave
-------------------------------------------
```

© 2012 Meru Networks, Inc.

```
                Master Controllers

            Hostname       IP Address  Admin
-----------------------------------------------
                3000-1       10.1.1.10   Disabled
3000-1#
```

Note: Slave configuration commands are not operable when the Slave is Active.

```
3000-1# configure terminal
3000-1(config)# nplus1 add 3000-3 10.1.1.13
ERROR: Cannot add Master controller while being ACTIVE Slave
3000-1(config)#
```

Managing the N+1 Installation

The tasks to manage an N+1 installation include:

- **Enabling Non-Revertive mode**
- **Scheduling revert on Active slave**
- **Cancel the Schedule Revert**
- **Reverting the Active Slave to Standby**
- **Changing the WTR Interval**
- **Disabling and Deleting N+1 Master Controllers**
- **Stopping N+1 Installations**
- **Replacing a Master Controller**
- **Working with N+1 Syslog**

Enabling Non-Revertive mode

To control the N+1 failback operation, a non-revertive mode is used on the passive slave controller. When the non-revertive mode is enabled, post the N+1 failover state, the active slave remains active though master is the back up. Here, the master remains in standby mode till the active slave reverts back to passive either forcibly or at the scheduled time.

On passive slave, use the following commands to,

- enable the non-revertive mode - **`nplus1 non-revertive enable`**
- disable the non-revertive mode - **`nplus1 non-revertive disable`**

 © 2012 Meru Networks, Inc.

Scheduling revert on Active slave

A revert can scheduled only on the active slave or passive to active slave state. Before scheduling a revert, a non-revertive must be enabled.

Revert can be scheduled using the following command,

nplus1 revert schedule <month/day/year> <hh:mm:ss>

For Example:

```
nplus1 revert schedule 12/01/2012 01:02:03
Master1(15)# sh nplus1
-------------------------------------------------
            Current State : Active Slave
       Non-Revertive Mode : Enable
         Scheduled Revert : Thu Jan 12 01:02:03 2012
    Wait to Restore (WTR) : 8 minutes
           Master Timeout : 5 keepalives
                Master IP : 10.1.1.10
          Master Hostname : MasterNplus1
                 Slave IP : 10.1.1.21
           Slave Hostname : slave4200
             License Type : Licensed
 License Usage (Used/Tot) : 1/1
-------------------------------------------------
              Master Controllers

            Hostname       IP Address  Admin
-------------------------------------------------
              Master1    10.1.1.10  Enable
Master1(15)#
```

At this time, the active slave switches the role to standby master and reverts to the passive state.

Cancel the Schedule Revert

To **Cancel the Schedule Revert** the following command is used:

nplus1 revert cancel

Reverting the Active Slave to Standby

You may want to change the role the active slave back to standby slave if it becomes obvious that the failed controller will be offline for some time. By reverting the slave from active to standby, the cluster can continue to be monitored.

Use the **nplus1 revert** command to change the status of the slave from active to standby.

© 2012 Meru Networks, Inc.

Changing the WTR Interval

To provide stability and reduce unintended failback flip-flopping, a Wait to Restore (WTR) count-down timer is used to count down before the Standby slave can again take over the role of a Master unit it recently relinquished. By default, this interval is set for 8 minutes, but can be changed to a number of minutes from 1 to 20 minutes.

To change the interval, use the **nplus1 wtr set** command:

```
3000-slave# configure terminal
3000-slave(config)# nplus1 wtr set minutes
3000-slave(config)# end
```

To clear the counter on a Master Controller that is in the process of counting down and start an immediate failover, use the **nplus1 wtr clear** command:

```
3000-slave# configure terminal
3000-slave(config)# nplus1 wtr clear Master_IP_addr
3000-slave(config)# end
```

Disabling and Deleting N+1 Master Controllers

To disable N+1 operation on a master controller, but still maintain its configuration in the cluster, from the slave controller, use the **nplus1 disable** command, with the IP address of the controller you are deleting:

```
3000-slave# configure terminal
3000-slave(config)# nplus1 disable 10.1.1.10
3000-slave(config)# end
```

To remove an N+1 master controller from the cluster, from the slave controller, use the **nplus1 delete** command, with the IP address of the controller you are deleting:

```
3000-slave# configure terminal
3000-slave(config)# nplus1 delete 10.1.1.10
3000-slave(config)# end
```

Stopping N+1 Installations

N+1 Slave and N+1 Master Controllers must be stopped separately.

Stopping N+1 Slave Controllers

To stop N+1 on a Slave Controller:

```
3000-slave# configure terminal
3000-slave(config)# nplus1 stop
Making this a normal controller.
3000-slave(config)# exit
3000-slave#
```

Stopping N+1 Master Controllers

To stop N+1 on a Master Controller:

 © 2012 Meru Networks, Inc.

```
3000-1# configure terminal
3000-1(config)# nplus1 stop
3000-1(config)# exit
```

Replacing a Master Controller

Should a Master Controller in the cluster need to be replaced, the following summarizes the steps needed to replace a Master Controller.

1. On the Slave Controller, disable the failed Master Controller:

   ```
   3000-slave# configure terminal
   3000-slave(config)# nplus1 disable <master IP-addr>
   3000-slave(config)# exit
   ```

2. Stop the failed Master Controller N+1 services (skip if Master Controller is not functioning):

   ```
   3000-master# configure terminal
   3000-master(config)# nplus1 stop
   3000-master(config)# exit
   ```

3. Power down the failed Master Controller (skip if Master Controller is not functioning):

   ```
   3000-master(config)# poweroff
   ```

4. Physically remove the failed controller and replace it with the new controller. (New controller must be running the same version of System Director as the Slave Controller and have the same static IP address that the replaced controller had.)

5. On the Slave Controller, execute the **nplus1 access** command to allow access to the newly added Master Controller:

   ```
   3000-slave# configure terminal
   3000-slave(config)# nplus1 access master_IP_addr
   ```

6. On the Slave Controller, enable the new Master Controller:

   ```
   3000-slave(config)# nplus1 enable master_IP_addr
   3000-slave(config)# exit
   ```

On the Slave Controller, give access permission for the new Master Controller:

```
3000-slave(config)# nplus1 access master_IP_addr
```

Working with N+1 Syslog

Checking the Syslog Debug Level

The **show nplus1 debugloglevel** command shows the level of verboseness set for the N+1 log messages.

```
3000-slave# sh nplus1 debugloglevel
nplus1 Debug Logging Level: 0
3000-slave#
```

© 2012 Meru Networks, Inc.

Setting the syslog Debug Level

The **nplus1set debugloglevel** command sets the level of verboseness for the N+1 log messages. The level can be set from 0 to 3, where 1 is the least verbose. The default 0 setting disables syslog messaging.

```
3000-slave(config)# nplus1 setdebugloglevel 1
```

N+1 Syslog Messages

Syslog messages are generated and sent to a log file on the syslog server configured with the **syslog-host** command. These message are sent by a standalone N+1 slave controller when an error condition occurs. A sample syslog message follows:

```
Oct 26 14:02:45 slave nplus1_Slave: <error message>
```

The list of syslog messages are as follows:

Error Message	Description/Remedy
IP address not assigned. Please run setup before using nplus1	The command **nplus1 start slave** executed, but no IP address exists for the controller. Run the **setup** command on that controller and assign the controller a static IP address.
ERROR: Could not get software version from file: *meru_sw_version_file*	Couldn't determine the System Director software version.
Rejecting record *number* due to parsing issues	Error reading the persistent record of configured masters. Manually add the Master Controllers again.
Could not open socket for CLI server	Problem initializing the N+1 CLI.
CLI server: Bind error for server ip: *ip* port: *port*	Issues in initializing N+1 CLI.
ALERT: Software Mismatch: Master (*master_ip*): software_version Slave (*slave_ip*): *software_version*	The Master Controller advertisement revealed a software mismatch. While the version mismatch occurs, the Master Controller cannot provide redundancy. Install on the Master Controller the same software version as the Slave Controller (or vice versa).
Copyback failed for master controller: *master_ip*	Configuration of Master Controller changed while the Slave was active, and the copyback failed. Remove the new Master Controller configuration changes, failback the Master Controller, and then perform the needed configuration changes.

 © 2012 Meru Networks, Inc.

For MC: *master_ip* State: SW Mismatch -> No Access - Saved Config does not exist	Software mismatch was resolved, but the Master Controller is not accessible from the Slave Controller and cannot provide redundancy. Ensure that the Master Controller is accessible using the command **nplus1 access** *master_ip*.
For MC: *master_ip* State: WTR Set-> WTR - Copyback Done	Failback process has begun, WTR timer initiated and is in the process of counting down, and the Master Controller is accessible. The failback process cannot complete and the Master Controller cannot provide redundancy until WTR expires.
For MC: *master_ip* State: WTR Set-> WTR - No Access	Failback process has begun, WTR timer initiated and is in the process of counting down, but the Master Controller is not accessible. Ensure that the Master Controller is accessible, and verify by using the command **nplus1 access** *master_ip*.
Could not access host: *master_ip*. Setting No Access Count to: *count*	Could not access the Master Controller. The Master Controller cannot provide redundancy until it is accessible. Access will be rechecked after *count* (default is 60 seconds). The problem may be caused by a gateway failure. Ensure that the Master Controller is accessible, and verify by using the command **nplus1 access** *master_ip*.

Recovering From N+1 Failover

When an N+1 master controller goes down, the slave controller transitions from passive slave to active slave (failover) and starts acting as the master controller. When the original master comes back up, the active slave becomes the passive slave again (fallback). The APs then reboot and discover the master controller again.

Note: If non-revertive mode is enabled, the Active to Passive Slave transition does not take place until revert is executed at its scheduled time/date or it should be executed forcibly. During this scenario, the standby master takes over the master role. The APs drop the Active slave and discovers the original master controller again.

Recovering From N+1 with Dual Ethernet Failover

On the Master controller, when the first Ethernet interface goes down, the controller fails over to second interface of the same controller. If the second interface goes down, Nplus1 failover takes place and the N+1 passive slave becomes an active slave with Dual Ethernet redundant configuration.

© 2012 Meru Networks, Inc.

The active slave is now in control. If the first active slave Ethernet interface goes down, the slave controller fails over to the second Ethernet interface.

To revert the failover, verify that the first interface on the Slave controller is up and running. Then, bring up the first interface of the original Master controller. The N+1 active slave becomes a passive slave and the original N+1 master becomes the N+1 Master again.

Caution! If the first interface on the Slave controller is not running when the Master controller's first interface is brought online, the Active Slave would transition to a Passive Slave. However, since the first interface is not online, the N+1 module will assume that the Master controlelr is down and try to resume the Master role itself. This can cause a loop in functionality. To avoid this, always ensure that the first interface on the Slave controller is up prior to bringing up the same interface on the Master controller.

Option 43

Option 43 is not part of any Meru product; it is a method for mapping controllers. With DHCP Option 43, you can specify a primary and backup controller for APs. With this configuration, the backup controller can be in a different subnet from the primary controller. Option 43 implements redundancy by specifying which controllers (primary and secondary) an AP should associate to. This feature is supported across all access points. A backup controller can be configured using either DHCP or DNS.

For example, using Option 43, if "wlan-controller" is mapped to P1 (and P1 has a redirect to P2) and "wlan-controller-2" is mapped to S1 (and S1 has a redirect to S2), the discovery order would be P1, P2, S1, S2. If a controller has both a DNS entry and Option 43 enabled, the AP will first use the host address as configured on the AP (default value = wlan-controller). If the host address is configured as 0.0.0.0 or if the host is a name and the name cannot be resolved using DNS, only then will the AP look at the DHCP Option 43 value.

For specific Option 43 configuration directions, see the Support Portal **How-To** 4062-125.

AP Aware Redundancy using DHCP Option 43

- Configure APs with L3 preferred and the controller name as 0.0.0.0
- On the DHCP server, Option 43 values need to be configured with primary and secondary controller IPs and/or hostnames. Then, when an AP contacts the DHCP server to obtain an IP address, it also receives primary and secondary controller IP information using the Option 43 value from the DHCP server.

 © 2012 Meru Networks, Inc.

AP Aware Redundancy using DNS

- Configure APs with L3 preferred and the controller name as the hostname of the controller.
- Configure a DNS entry to resolve the primary hostname on the DNS server. Configure a DNS entry to resolve the secondary hostname on the DNS server.
- Configure the hostname of the primary controller on the AP with L3 preferred mode.

Chapter 7
Configuring Network Interfaces

One of the first steps when setting up a controller is to configure the networking parameters using the **setup** program, as described in the *Meru System Director Getting Started Guide.* If you did not run the **setup** program, or if you want to change the settings that were configured with the **setup** script, you can use the commands described in the section **Configuring Basic Networking for the Interface**.

Because controllers have two FastEthernet ports, you may want to configure the second port for additional operation. The second port can be used as redundant interface or as a second active FastEthernet interface. To configure the Dual-Ethernet feature, refer to the section **Dual-Ethernet Operation**. Note that after a change like this, you need to reboot the controller.

Configuring Basic Networking for the Interface

Use the following commands to configure network parameters, if necessary:

- To change the parameters of the FastEthernet port, use the **interface FastEthernet** command.
- To set up a dynamic IP address assignment for the wireless clients using the DHCP relay server, use the **ip dhcp-server** *ip-address* command.
- To set the IP address of the controller, use the **ip address** *ip-address netmask* command.
- To set the default gateway, use the **ip default-gateway** *ip-address* command.
- To set the domain name, use the **ip domainname** *name* command.
- To add one or more DNS name servers, use the **ip dns-server** *ip-address* command.

For additional information about configuring network information, see the *Meru System Director Getting Started Guide.* For more information about the listed commands, see the *Meru System Director Command Reference.*

© 2012 Meru Networks, Inc.

802.11d Support

The original 802.11 standard defined operation in only a few regulatory domains (countries). 802.11d added the ability for 802.11 WLAN equipment to operate in additional countries by advertising the country code in the beacon. Devices pick up the country code and adjust communication accordingly. You do not have to configure or enable this feature; the Meru implementation currently works automatically for all countries listed in setup. There is no show command that displays this feature. Validate 802.11d in the 802.11 Beacons and Probe Response, Country code IE field.

Dual-Ethernet Operation

Dual-Ethernet support enables the controller's second Ethernet port and provides the ability for it to work either as a redundant interface or a second active interface.

If the second interface is configured as **redundant**, it will serve as a backup interface to the first interface. This means that it will be idle as long as the first interface is functional and will perform all functions of the first interface if the first interface fails. In a redundant configuration, the first interface must have a static IP address.

If the second interface is configured as **active**, it can be configured as a separate interface that can support an additional configuration, for example to support GRE tunneling while the first interface is configured for VLANs.

Note: The first Ethernet interface is treated as the default interface. The responsibility of the default interface is to pass wireless tunnel traffic between the APs and the controller. In addition to the general support of GRE and VLAN, the default interface is also the designated management interface for the controller, providing support for management access traffic via SSH and HTTPS.

It is implicit in the configuration of redundant mode that the second Ethernet interface should be connected to a switch port in which it can perform the same functions as the default Ethernet interface.

Note that when changing from redundant to dual active operation, a controller reboot is required.

Configuring Dual Ethernet

The second Ethernet interface can be configured as either **redundant** or **active.** An **active** interface can be used to support a VLAN or GRE (Generic Routing Encapsulation) tunneling. A **redundant** interface is a backup interface in case the primary interface fails.

 © 2012 Meru Networks, Inc.

Note: Do not insert an Ethernet cable into the second Ethernet port until it has been configured as **active** or **redundant**.

Configuring a Redundant Interface

See the chapter **Implementing Redundancy**.

Configuring an Active Interface

The following commands configure Ethernet port 2 as an **active** interface that can be used to support a VLAN or GRE (Generic Routing Encapsulation) tunneling. The **ip address** specifies the IP address of the VLAN or GRE local endpoint followed by the associated netmask. The **gw** command specifies the gateway address, and is a mandatory field.

```
default# configure terminal
default(config)# interface FastEthernet 2
default(config-if-FastEth)# ip address 172.26.16.200 255.0.0.0
default(config-if-FastEth)# gw 172.26.16.1
default(config-if-FastEth)# type active
default(config-if-FastEth)# exit
default(config)# exit
```

Note that when changing from redundant to dual active operation, a controller reboot is required.

Note: In the active configuration, the second Ethernet interface must be configured with a static IP address (not DHCP) to a different L2 domain than the primary interface.

After completing the interface configuration above, to configure a GRE tunnel, see **Configure GRE Tunnels** in the Security chapter.

Viewing FastEthernet Interface Information

To view the FastEthernet interface 1 configuration, use the **show interfaces FastEthernet controller** or **show interfaces FastEthernet ap** commands to display information relating to each type of interface.

To view the FastEthernet interface 2 redundant configuration, use the command **show second_interface_status**.

© 2012 Meru Networks, Inc.

Interface and Networking Commands

The following interface and networking configuration commands are available.

Table 4: Interface and Networking Commands

Command	Purpose
`controller(config)# interface FastEthernet controller interface-index`	Specify the controller interface index (0-31) and enter FastEthernet interface configuration submode.
`controller(config)# ip address ip-address mask`	Specifies the IP address and subnet mask for the controller. This is used to specify the static IP address if you are not enabling DHCP.
`controller(config)# gw ip-address`	Specifies the IP address of the default gateway. Used to specify the gateway if you are not using DHCP.
`controller# setup`	Interactive script that helps set up hostname and other system and networking parameters.
`controller# show interfaces FastEthernet statistics`	Displays the summary table of Ethernet statistics for the controller and APs.
`controller# show interfaces FastEthernet statistics controller`	Displays the Ethernet statistics for the controller.
`controller# show interfaces FastEthernet statistics ap id`	Displays the Ethernet statistics for the AP with the given node ID.
`controller# show second_interface_status`	Displays the status of the second FastEthernet interface when configured for redundant mode.

 © 2012 Meru Networks, Inc.

Chapter 8
Configuring Security

System Director provides industry-standard security options that can be implemented according to the requirements of the ESSID (and VLAN, if so configured) to protect the site's wireless and, as a result, wired LAN infrastructure.

- **Configuring Wireless LAN Security**
- **Configure a Security Profile With the Web UI**
- **Encryption Support**
- **Configure GRE Tunnels**
- **Configure a Security Profile With the CLI**
- **Policy Enforcement Module**
- **Proactive Spectrum Manager**
- **RSA SecurID Authentication**
- **Configure MAC Filtering**
- **Security Certificates**

Also see the security-related chapters **Authentication**, **Captive Portals for Temporary Users**, and **Rogue AP Detection and Mitigation**.

Configuring Wireless LAN Security

In Meru Wireless LAN System, Layer 2 and Layer 3 security options are enforced by creating Security Profiles that are assigned to an ESSID. As such, they can be tailored to the services and the structure (virtual LAN, Virtual Cell, etc.) offered by the ESSID and propagated to the associated APs. Security profiles for a controller can also be configured from E(z)RF Network Manager. You can tell where a profile was configured by checking the read-only field Owner. The Owner is either **E(z)RF** or **controller**. The general security configuration tasks are as follows:

1. Create VLANs to keep the client traffic in each SSID secure and separate from clients in other SSIDs. See the chapter **Configuring VLANs** for directions.

© 2012 Meru Networks, Inc.

2. Set up the Certificate Server or Radius server configuration (see the Radius server documentation for instructions).
3. Configure Security Profiles based on the type of security required (continue with the following sections).
4. Configure one or more ESSIDs (see the chapter **Configuring an ESS** for directions) and assign the VLAN and Security Profile to them.

Configure a Security Profile With the Web UI

To configure Security Profile parameters, follow these steps:

1. Click **Configuration > Security > Profile**.
2. In the Security Profile Name box, type the name of the security profile. The name can be up to 32 alphanumeric characters long and cannot contain spaces.
3. In the L2 Modes Allowed area, select one of the following Layer 2 security modes:
   - **Clear**: The WLAN does not require authentication or encryption, and the WLAN does not secure client traffic. This is the default setting.
   - **802.1X**: Can provide 802.1X authentication and WEP64 or WEP128 encryption.
   - **Static WEP keys**: Requires that stations use a WEP key (see step 6).
   - **WPA**: Requires 802.1X Radius server authentication with one of the EAP types; see step 4 to select a pre-configured Radius server profile. For more information, see **Wi-Fi Protected Access (WPA and WPA2)**.
   - **WPA PSK**: Uses the TKIP encryption protocol and requires a shared key (see step 11 to enter the shared Key).
   - **WPA2**: Requires 802.1x Radius server authentication with one of the EAP types (see step 4 to select a pre-configured Radius server profile). For more information, see **Wi-Fi Protected Access (WPA and WPA2)**.
   - **WPA2 PSK**: Uses the CCMP-AES encryption protocol and requires a pre-shared key (see step 12 to enter the pre-shared key).
   - **MIXED**: Allows both WPA and WPA2 clients using a single security profile.
   - **MIXED PSK**: Allows pre-shared key clients to use a single security profile.
4. In the Data Encrypt area, select one of the following (available choices are determined by the L2 Mode selected):
   - **WEP64**: A 64-bit WEP key is used to encrypt packets. For more information, see **WEP Security Features**.
   - **WEP128**: A 128-bit WEP key is used to encrypt packets. For more information, see **WEP Security Features**.
   - **TKIP**: Encryption algorithm used with WPA; uses a 128-bit key and 64-bit Initialization Vector (IV).
   - **CCMP-AES**: A 128-bit block key is used to encrypt packets with WPA2. For more information, see **CCMP-AES**.

 © 2012 Meru Networks, Inc.

- **CCMP/TKIP**: Use the Counter Mode with Cipher Block Chaining (CCMP) encryption protocol that replaces TKIP, the mandatory protocol in WPA, and WEP. For more information, see **TKIP**.

If you select WEP64 or WEP128, you need to specify a WEP key, as described in step 6. If you specify TKIP for WPA-PSK or CCMP-AES for WPA2-PSK, a pre-shared key must be set, as described in step 12.

5. From the Primary Radius Profile Name list, select one of the configured Radius Server Profiles for use as the primary server or select the **No Radius** option. If no Radius Server Profiles have been configured, the selectable list is unavailable and the text “No Data for Primary Radius Profile Name” displays. To configure a Radius Server Profile, click **Configuration > Security > Radius**.
6. From the Secondary Radius Profile Name list, select one of the configured Radius Server Profiles for use as the secondary server or select the No Radius option. If no Radius Server Profiles have been configured, the selectable list is unavailable and the text “No Data for Primary Radius Profile Name” displays. To configure a Radius server profile, click **Configuration > Security > Radius**.
7. In the WEP Key box, specify a WEP key. If you selected Static WEP Keys in step 2, you need to specify a WEP key in hexadecimal or text string format.

   A WEP64 key must be 5 octets long, which you can specify as 10 hexadecimal digits (the hexadecimal string must be preceded with 0x) or 5 printable alphanumeric characters (the ! character cannot be used). For example, 0x619B947A3D is a valid hexadecimal value, and wpass is a valid alphanumeric string.

   A WEP128 key must be 13 octets long, which you can specify as 26 hexadecimal digits (the hexadecimal string must be preceded with 0x) or 13 printable alphanumeric characters (the ! character cannot be used). For example, 0xB58CE2C2C75D73B298A36CDA6A is a valid hexadecimal value, and mypass8Word71 is a valid alphanumeric string.
8. In the Static WEP Key Index box, type the index number to be used with the WEP key for encryption and decryption. A station can have up to four static WEP keys configured. The static WEP key index must be an integer between 1 through 4 (although internal mapping is performed to handle wireless clients that use 0 through 3 assignments).
9. In the Re-Key Period box, type the duration that the key is valid. Specify a value from 0 to 65,535 seconds. The default re-key value is zero (0). Specifying 0 indicates that re-keying is disabled, which means that the key is valid for the entire session, regardless of the duration.
10. In the Captive Portal list, select one of the following:
    - **Disabled**: Disables Captive Portal.
    - **WebAuth**: Enables a WebAuth Captive Portal. This feature can be set for all L2 Mode selections.
11. If you want to use a third-party Captive Portal solution from a company such as Bradford, Avenda, or CloudPath change the value for Captive Portal Authentication Method to **external**. For more information, see **Third-Party Captive Portal Solutions**.
12. To use 802.1X, select one of the following in the 802.1X Network Initiation list:

© 2012 Meru Networks, Inc.

- **On**: The controller initiates 802.1X authentication by sending an EAP-REQUEST packet to the client. By default, this feature is enabled.
- **Off**: The client sends an EAP-START packet to the controller to initiate 802.1X authentication. If you select this option, the controller cannot initiate 802.1X authentication.

13. 802.1x Termination: 802.1x-Termination is provided by IOSCLI and Controller GUI, to perform configuration on per-security profile basis. Select one of the following in the 802.1x Termination list:
    - **PEAP**: PEAP (Protected Extensible Authentication Protocol) is a version of EAP, the authentication protocol used in wireless networks and Point-to-Point connections. It is designed to provide more secure authentication for 802.11 WLANs (wireless local area networks) that support 802.1X port access control. It authenticates the server with a public key certificate and carries the authentication in a secure Transport Layer Security (TLS)
    - **TTLS**: TTLS (Tunneled Transport Layer Security) is a proposed wireless security protocol.

Note: Note that when 802.1x Termination is enabled, Meru's default certificate is used. In this case, the certificate must be "trusted" on the wireless client end in order for authentication to be successful. Refer to **Security Certificates** for details on how to import a certificate.

Note: When PEAP/TTLS is configured on the Radius server, PEAP/TTLS termination should be disabled.

14. If the Static WEP Key mode is used, in the Shared Key Authentication list, select one of the following:
    - **On**: Allows 802.1X shared key authentication.
    - **Off**: Uses Open authentication. By default, this feature is off.
15. In the Pre-shared Key text box, enter the key if either WPA-PSK or WPA2-PSK was selected in step 2 above. The key can be from 8 to 63 ASCII characters or 64 hex characters (hex keys must use the prefix "0x" or the key will not work).
16. In the Group Keying Interval text box, enter the time in seconds for the interval before a new group key is distributed.
17. In the Key Rotation drop-down list, select whether to **enable** or **disable** this feature.
18. The timeout value for Backend Authentication Server Timeout can be 1-65535 seconds.
19. For Re-authentication, select one of the following:
    - **On**: Causes the controller to honor and enforce the "Session-timeout" Radius attribute that may be present in a Radius Access-Accept packet. A customer would use this option if the Session-timeout attribute is used to require stations to re-authenticate to the network (802.1X) at a specified period. If "Session-timeout" is not used, there is no reason to enable re-authentication.
    - **Off**: Disables re-authentication for this security profile.

 © 2012 Meru Networks, Inc.

20. In the MAC Filtering list, select one of the following:
    - **On**: Enables MAC Filtering for this security profile.
    - **Off**: Disables MAC Filtering for this security profile.
21. In the Firewall Capability drop-down list, select one of the following:
    - **Configured**: The controller defines the policy through configuration of the Firewall filter-id.
    - **Radius-configured**: The Radius server provides the policy after successful 802.1X authentication of the user. This option requires the Radius server have the filter-id configured. If this is not configured, the firewall capability is not guaranteed.
    - **None**: Disables the Firewall Capability for this security profile.
22. In the Firewall Filter ID text box, enter the firewall filter-id that is used for this security profile. The filter-id is an alphanumeric value that defines the firewall policy to be used on the controller, when the firewall capability is set to configured. For example, 1.
23. In the Security Logging drop-down list, select one of the following:
    - **On**: Enables logging of security-related messages for this security profile.
    - **Off**: Disables logging of security-related messages for this security profile
24. In the Passthrough Firewall Filter ID text box, enter a firewall filter ID that was created using **Configuration > QoS > System Settings > QoS and Firewall Rules > Add**. The filter ID is an alphanumeric value that defines the firewall policy to be used on the controller for a Captive Portal-enabled client that has no authentication.
25. Click **OK**.

Wi-Fi Protected Access (WPA and WPA2)

Meru Meru Wireless LAN System supports both WPA2 and WPA protocols that have been presented by the Wi-Fi Alliance as interim security standards that improve upon the known vulnerabilities of WEP until the release of the 802.11i standard.

In WPA2, the WPA Message Integrity Code (MIC) algorithm is replaced by a message authentication code, CCMP, that is considered fully secure and the RC4 cipher is replaced by the Advanced Encryption Standard (AES), as described in **CCMP-AES**.

WPA includes the encryption protocol TKIP (see **TKIP**) and leverages existing 802.1X authentication (see **802.1X Authentication**), including the dynamic key management facility.

If 802.1X authentication is not available (in a SOHO, for example), WPA2-Personal or WPA-Personal can be implemented as alternatives and provide for manual key distribution between APs and clients.

To achieve a truly secure WPA/WPA2 implementation, the installation must be “pure,” that is, all APs and client devices are running either WPA-Enterprise or WPA2-Enterprise. Implement this for Meru Wireless LAN System with an ESS that uses

© 2012 Meru Networks, Inc.

a Security Profile that configures WPA/WPA2, leverages the site's 802.1X user authentication and includes TKIP or CCMP encryption. Once associated with this profile, users and enterprises can be assured of a high level of data protection.

You can mix WPA and WPA2 security in System Director release 3.6 and later.

To configure these security options see the sections **Configure a Security Profile With the Web UI** and **Configure WPA2 With the CLI**.

 © 2012 Meru Networks, Inc.

Encryption Support

Meru Wireless LAN System offers CCMP-AES for WPA2 and TKIP for WPA. A key difference between WPA and WPA2 is the underlying encryption method. For WPA2 it is CCMP/AES and for WPA it is TKIP/RC4. Descriptions of these technologies are provided in this section. Meru also supports the original 802.11encryption protocols provided by WEP64 and WEP128.

We recommend using the more secure CCMP, or the TKIP encryption solution if your site's client hardware cannot support CCMP.

CCMP-AES

AES is the Advanced Encryption Standard and is used by the US Department of Defence as a replacement for older encryption standards. As such, it is *very* secure. AES can be used in several modes, and CCMP is the mode used by WPA2. Both terms are commonly used interchangeably.

TKIP

As part of the WPA solution to address the weaknesses in WEP, WPA uses Temporal Key Integrity Protocol (TKIP) to improve upon WEP security by expanding the size of the encryption key and Initialization Vector (IV), increasing the number of keys in use, and creating a message integrity check.

TKIP is a Layer 2 encryption algorithm that uses a 128-bit key and a 64-bit IV. TKIP uses the RC4 algorithm along with a symmetrical key to produce encrypted text. The symmetrical key is used for encrypting and decrypting packets, and can be automatically distributed to an AP and from there to the user station when 802.1X EAP is implemented. TKIP key management system uses one of a possible 500 trillion keys to uniquely encrypt each data packet. TKIP uses the Message Integrity Check (MIC), a function that computes and compares a per-packet integrity check to ensure the content of the packets have not been modified by an outside source during packet transmission. If the sent/received checksums do not match, the packet is assumed to be tampered with and dropped.

To configure TKIP, see the section **Configure WPA With the CLI**.

WEP Security Features

Wired Equivalent Privacy (WEP64 and WEP128) is a Layer 2 security protocol specified in the IEEE Wireless Fidelity (Wi-Fi) standard, 802.11. WEP is designed to provide a wireless LAN with comparable level of security and privacy to what is usually expected of a wired LAN. A wired LAN is generally protected by physical security mechanisms, such as controlled access to a building, that are effective for a controlled physical environment. However, such security mechanisms do not apply to

© 2012 Meru Networks, Inc.

WLANs because the walls containing the network do not necessarily bind radio waves. WEP seeks to establish protection similar to that offered by the wired network's physical security measures by encrypting data transmitted over the WLAN. Data encryption protects the vulnerable wireless link between clients and access points. Once this measure has been taken, other typical LAN security mechanisms such as authentication, password protection, and end-to-end encryption, can be put in place to protect privacy.

With the WEP protocol, all access points and client radio NICs on a particular wireless LAN must use the same encryption key. Each sending station encrypts the body of each frame with a WEP key before transmission, and the receiving station decrypts it using an identical key. This process reduces the risk of someone passively monitoring the transmission and gaining access to the information contained within the frames.

The WEP implementation allows the Security Profile configuration to specify one of four possible WEP keys that can be configured by a user station key management program.

To configure WEP, see the section **Configure 802.11 WEP Encryption**.

Operation of the WEP Protocol

If a user activates WEP, the NIC encrypts the payload, which consists of the frame body and cyclic redundancy check (CRC), of each 802.11 frame before transmission using an RC4 stream cipher provided by RSA Security. The receiving station, such as an access point or another radio NIC, performs decryption when it receives the frame. As a result, 802.11 WEP only encrypts data between 802.11 stations. Once the frame enters the wired side of the network, such as between access points, WEP no longer applies.

As part of the encryption process, WEP prepares a key schedule (“seed”) by concatenating the shared secret key supplied by the user of the sending station with a randomly-generated 24-bit initialization vector (IV). The IV lengthens the life of the secret key because the station can change the IV for each frame transmission. WEP inputs the resulting “seed” into a pseudo-random number generator that produces a key stream equal to the length of the frame's payload plus a 32-bit integrity check value (ICV).

The ICV is a checksum that the receiving station later recalculates and compares to the one sent by the sending station to determine whether the transmitted data underwent any form of tampering while in transit. In the case of a mismatch, the receiving station can reject the frame or flag the user for potential security violations.

With WEP, the sending and receiving stations use the same key for encryption and decryption. WEP specifies a shared 40- or 104-bit key to encrypt and decrypt data (once the 24-bit IV is added in, this matches System Director’s 64- or 128-bit WEP specification, respectively). Each radio NIC and access point, therefore, must be manually configured with the same key.

 © 2012 Meru Networks, Inc.

Before transmission takes place, WEP combines the key stream with the payload and ICV through a bit-wise XOR process, which produces cipher text (encrypted data). WEP includes the IV in the clear (unencrypted) within the first few bytes of the frame body. The receiving station uses this IV along with the shared secret key supplied by the user of the receiving station to decrypt the payload portion of the frame body.

Limitations of the WEP Protocol

WEP is vulnerable because the relatively short IVs and keys remain static. Within a short amount of time, WEP eventually uses the same IV for different data packets. For a large busy network, the same IVs can be used within an hour or so. This results in the transmitted frames having key streams that are similar. If a hacker collects enough frames based on the same IV, the hacker can determine the shared values among them (the key stream or the shared secret key). This can allow to the hacker to decrypt any of the 802.11 frames.

A major underlying problem with the existing 802.11 standard is that the keys are cumbersome to change. The 802.11 standard does not provide any functions that support the exchange of keys between stations. To use different keys, an administrator must manually configure each access point and radio NIC with a new common key. If the WEP keys are not updated continuously, an unauthorized person with a sniffing tool can monitor your network and decode encrypted frames.

Despite the flaws, you should enable WEP as a minimum level of security. Many hackers are capable of detecting wireless LANs where WEP is not in use and then use a laptop to gain access to resources located on the associated network. By activating WEP, however, you can at least minimize this from happening. WEP does a good job of keeping most honest people out.

Configure GRE Tunnels

The GRE tunneling provides packet isolation from one endpoint to another, encapsulated within an IP tunnel to separate user traffic.

GRE Tunneling facilitates configurations as shown in **Figure 11**, where guest users who are logged into a guest ESS are given “guest” Internet access at Level 1 and have their traffic separated from corporate users who are on a common shared link to the corporate campus. Contract users have similar connection as corporate users but are restricted in access to certain sites by user firewall policies.

GRE tunneling provides an option to segregate users’ traffic by allowing an ESS profile to be tied to a GRE profile. This provides an alternative to VLANs for segregating traffic.

© 2012 Meru Networks, Inc.

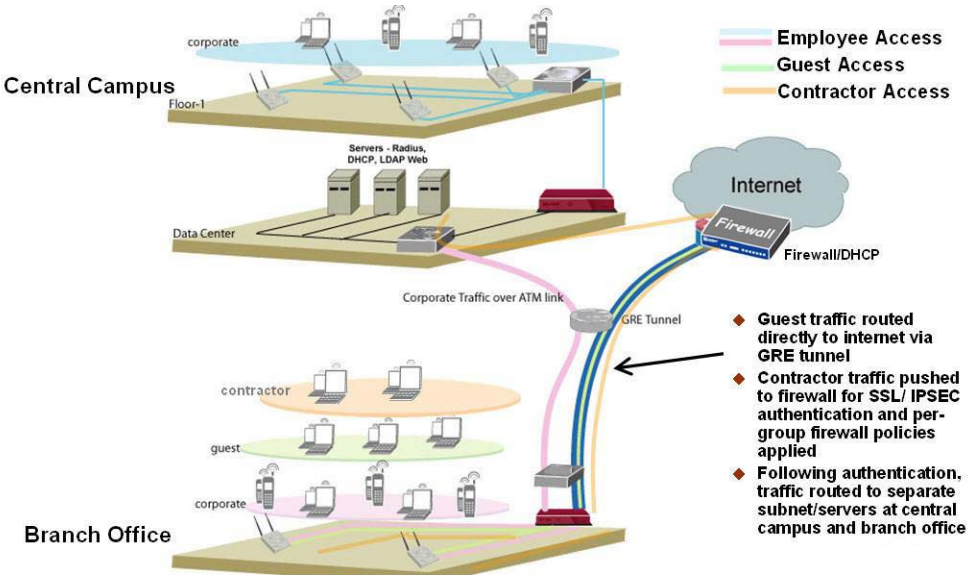

Figure 11: Example GRE Tunneling Configuration

To configure GRE tunneling, create the GRE tunnel profile as well as an ESSID that specifies the GRE tunnel and also references a Security Profile. GRE can also be configured from E(z)RF Network Manager.

All IP addresses configured for the tunnel must be unique; these IP addresses define the endpoints of the tunnel, with the **controller FastEthernet IP address** defining the local endpoint and the **ip remote-external-address** specifying the remote endpoint.The **ip tunnel-ip-address** defines the tunnel network.

Note: If the GRE Tunnel is to be configured on the second interface of a Dual-Ethernet configuration, be sure to configure the second Ethernet interface, as described in the section "**Configuring an Active Interface**" in the chapter "**Configuring Network Interfaces**."

The following example shows the commands for configuring a GRE tunnel profile on the second FastEthernet interface, where the IP address of the tunnel's local endpoint is 13.13.13.13 and the remote endpoint is 172.27.0.206, and the DHCP server is at 10.0.0.12:

```
default(config)# gre guest
default(config-gre)# interface FastEthernet controller 2
default(config-gre)# ip tunnel-ip-address 13.13.13.13 255.255.255.0
default(config-gre)# ip remote-external-address 172.27.0.206
default(config-gre)# ip dhcp-override
default(config-gre)# ip dhcp-server 10.0.0.12
default(config-gre)# end
```

To check the configuration of the GRE tunnel, use the **show gre** command:

 © 2012 Meru Networks, Inc.

```
default# show gre

GRE Name    Remote External Address   Tunnel IP address   Tunnel IP Netmask   LocalExternal

vlan1       172.27.0.162              12.12.12.12         255.255.0.0          1
gre1        172.27.0.206              13.13.13.13         255.255.0.0          2
         GRE Configuration(2 entries)
```

To configure the GRE ESSID, specify the GRE profile name, a tunnel-type and Security Profile, as shown in the following example:

```
default(config)# essid guest
default(config-essid)# gre name guest
default(config-essid)# tunnel-type gre
default(config-essid)# security-profile default
default(config)# exit
```

- The GRE ESSID name must be the same as the GRE Tunnel Profile name specified in the preceding GRE Configuration procedure (for example, guest). The GRE Tunnel Profile name is specified in the **gre name**.
- For the **tunnel-type**, the **gre** parameter must be specified for GRE Tunnel configuration.
- Specify the Security Profile name with the **security-profile** command—typically the **default** profile is used.

To check the status of the a GRE tunnel, use the command:

```
default# test gre gre_name ip_address
```

where *gre_name* is the GRE Profile name and *ip_address* is the IP address of the machine that is connected behind the tunnel (optional).

Note: By default, the command will ping the remote endpoint.

The following points should be noted when configuring a GRE tunnel:

- The DHCP relay pass-through flag always should be off for a GRE tunnel. This ensures the DHCP relay is always on and hence the DHCP request packets are forwarded to the DHCP Server specified by DHCP Server IP Address.
- DHCP traffic associated with users connecting to a GRE tunnel are relayed to the configured DHCP Server located at the remote location through the associated GRE tunnel.
- Only IPv4 support is provided for GRE tunneling.

Configure a Security Profile With the CLI

The controller supports the ability to define multiple Security Profiles that can be assigned to different wireless LAN extended service sets (ESS) according to the level and type of security required. A Security Profile is a list of parameters that define how security is handled within an ESS. With Security Profiles, you can define the Layer 2 security method, including the cipher suite, primary and secondary Radius server, static WEP key entries and key index position, and other parameters. The various Security Profiles you create allow you to support multiple authentication and encryption methods within the same WLAN infrastructure.

Note: Only one Layer 2 method can be defined in each Security Profile.

The controller is shipped with OPEN authentication, meaning that there is no authentication, and that any wireless client can connect to the controller. These setting are defined in the default Security Profile named *default*.

You can view the default Security Profile using the **show security-profile default** command.

```
default# show security-profile default

Security Profile Table

Security Profile Name                                : default
L2 Modes Allowed                                     : clear
Data Encrypt                                         : none
Primary Radius Profile Name                          :
Secondary Radius Profile Name                        :
WEP Key (Alphanumeric/Hexadecimal)                   : *****
Static WEP Key Index                                 : 1
Re-Key Period (seconds)                              : 0
Captive Portal                                       : disabled
802.1X Network Initiation                            : off
802.1x Termination                                   : PEAP, TTLS
Shared Key Authentication                            : off
Pre-shared Key (Alphanumeric/Hexadecimal)            : *****
Group Keying Interval (seconds)                      : 0
PMK Caching                                          : disabled
Key Rotation                                         : disabled
Reauthentication                                     : off
MAC Filtering                                        : off
Firewall Capability                                  : none
Firewall Filter ID                                   :
Security Logging                                     : off
```

The default Security Profile is configured to allow “clear” Layer 2 access with no authentication method, encryption, or cipher suite specified.

 © 2012 Meru Networks, Inc.

The 802.1x Termination is configured separately for PEAP and TTLS.

Configure 802.1X Radius Security With the CLI

To allow WLAN access to your site's 802.1X authorized and authenticated users, set up 802.1X Radius authentication. To do this:

- Create a global Radius Server Profile that specifies how to communicate with the primary Radius server in your network. If an optional secondary Radius server is to be used, a separate profile is also created for it.
- Create a Security Profile for the ESS that configures 802.1X Layer 2 security and assigns a primary Radius profile and optional secondary Radius profile

Refer to your Radius server documentation regarding how to configure the type of EAP protocol for your site and the procedure for installing any necessary certificates. The actual Radius server configuration is not covered here, only the configuration for enabling the communication between the Radius server and the controller is described.

The following commands set up a profile for the primary Radius server, *main-auth*, that specify the server's IP address and secret key. All other default parameters (such as the port number (1812)) are acceptable, and not changed:

```
default# configure terminal
default(config)# radius-profile main-auth
default(config-radius)# ip-address 10.1.100.10
default(config-radius)# key secure-secret
default(config-radius)# exit
```

For additional reliability, configure a secondary Radius Server Profile to serve as a backup should the primary server become unavailable.

```
default# configure terminal
default(config)# radius-profile backup-auth
default(config-radius)# ip-address 10.1.100.2
default(config-radius)# key secure-secret2
default(config-radius)# exit
```

Next, create the Security Profile that enables 802.1X and points to the profiles that describe the Radius primary and secondary servers.

Example Security Profile with 802.1X Radius

In the following example, the Security Profile *8021x-data* is created. It supports 802.1X authentication and uses the Radius profile *main-auth* to enable the primary Radius authentication server and the *backup-auth* profile for the secondary Radius server.

```
default(config)# security-profile 8021x-data
default(config-security)# allowed-l2-modes 802.1x
default(config-security)# radius-server primary main-auth
default(config-security)# radius-server secondary backup-auth
default(config-security)# exit
```

© 2012 Meru Networks, Inc.

```
default(config)# exit
```

802.1X PTK Rekey

With the 802.1X PTK rekey feature, whenever the rekey interval expires, the Access Point sends a unicast key and a broadcast key to the client. These two key packets are **NOT** encrypted.

To enable 802.1X PTK rekey, enter the following command from the Security Profile configuration: (*n* can be from 0 to 65535 (60 minutes), and is specified in seconds)

```
default(config-security)# rekey period n
```

To disable 802.1X PTK rekey, enter the following command from the Security Profile configuration:

```
default(config-security)# rekey period 0
```

802.1X GTK Rekey

To configure the 802.1X GTK rekey period, from the Security Profile configuration, add the following command (the rekey period is specified in seconds):

```
default(config-security)# group-rekey interval n
```

To disable 802.1X GTK rekey, enter the following command from the Security Profile configuration:

```
default(config-security)# no group-rekey interval
```

802.1X Radius Server Command Summary

The following commands are used to configure the Radius servers:

Table 5: Commands to Configure the 802.1X Radius Servers

Command	Purpose
radius-profile *name*	Creates a Radius server profile with the specified name and enters Radius profile configuration submode (maximum 16 characters).
description *text*	Configures a description of the profile (maximum 128 characters).
ip-address *ip-address*	Configures the IP address of the Radius profile (required parameter).

 © 2012 Meru Networks, Inc.

Table 5: Commands to Configure the 802.1X Radius Servers

Command	Purpose
key *key*	Specifies the shared secret text string used by the controller for the Radius profile (required parameter if **password-type** is **shared-secret**). Maximum 64 characters.
password-type shared-secret | **mac-address**	Specifies whether the password type is the Radius **key** (shared-secret) or is the MAC address of the client, as determined by the client setup in Radius for MAC Filtering configuration.
mac-delimiter colon | **hyphen** | **singlehyphen** | **none**	Optional. Sets the Radius profile delimiter character.
port *port*	Optional. Configures the Radius profile port (the default port 1812, is configured by default).
vlan *vlan*	Optional. Configures a VLAN for the RADIUS server. Use the command if the Radius server is located on a VLAN so that RADIUS requests are sent to the VLAN interface instead of default/untagged interface.
pmkcaching pmkcaching | disable	Enables or disables PMK caching.
rekey period *n*	Sets the PTK rekey period. The default is set to 60 seconds and the allowable range is 60 seconds to 60 minutes.
[no] group-rekey interval *n*	Sets the GTK group rekey period. The default is set to 60 seconds and the allowable range is 60 seconds to 60 minutes

Table 6: Commands Used to Create Security Profiles

Command	Purpose
allowed-l2-modes 802.1x	In Security Profile configuration, enables 802.1X authentication.
radius-server primary *profile*	In Security Profile configuration, specifies the Radius profile containing the configuration parameters for the primary Radius server.

© 2012 Meru Networks, Inc.

Table 6: Commands Used to Create Security Profiles

radius-server secondary *profile*	Optional. In Security Profile configuration, specifies the Radius profile containing the configuration parameters for the secondary Radius server.
rekey multicast-enable	Optional. In Security Profile configuration, enable the multicast key broadcast.
[no] 8021x-network-initiation	In Security Profile configuration, determines 802.1X initiation method. When enabled (default), the AP sends the first EAP packet (an EAP ID request) to the wireless station to start 802.1X after the wireless station completes 802.11 authentication and association to an 802.1X-enabled ESSID. With the command **no 8021x-network-initiation**, the wireless station sends an EAPOL Start packet to the AP to start the 802.1X exchange.

Configure WPA2 With the CLI

The controller supports the WPA2 standard that includes CCMP encryption which is considered extremely secure. Implementing WPA2 provides the highest level of security that the Meru Meru Wireless LAN System offers.

Additionally, if 802.1X is implemented at the site, automatic key exchange is provided by the Radius server. Existing primary and secondary Radius Server Profiles can be assigned from within the Security Profile to leverage the existing 802.1X authentication. Otherwise, the WPA2-PSK configuration can be implemented.

Example WPA2 Configuration

To configure WPA security with the Web UI, click **Configuration > Security > Profile**. Click **Help** for option details. Note that you can configure **MIXED** WPA and WPA2 in release 3.6 and later.

The following CLI example creates the profile named *wpa2-ccmp* that enables WPA2 for Layer 2, sets the encryption mode to CCMP-AES, and names the Radius server in the *main-auth* profile as the primary Radius authentication server.

```
default(config)# security-profile wpa2-ccmp
default(config-security)# allowed-l2-modes wpa2
default(config-security)# encryption-modes ccmp
default(config-security)# radius-server primary main-auth
default(config-security)# exit
default(config)# exit
```

 © 2012 Meru Networks, Inc.

Example WPA2-PSK Configuration

To configure security with the Web UI, click **Configuration > Security > Profile**. Click **Help** for option details.

When setting the PSK key with the CLI, use a key from 8 to 63 ASCII characters (the characters ! \ " ? must be escaped with the backslash (\) character; for example \! \?) or 64 hex characters (hex keys must be prefixed with "0x" or the key will not work).

The following example creates the profile named *wpa2-psk* that enables WPA2-PSK for Layer 2, sets the encryption mode to CCMP, and sets the preshared key to *theSecretKeyForNov28*.

```
default(config)# security-profile wpa2-psk
default(config-security)# allowed-l2-modes wpa2-psk
default(config-security)# encryption-modes ccmp
default(config-security)# psk key theSecretKeyForNov28
default(config-security)# exit
default(config)# exit
```

Configure WPA With the CLI

The controller supports the WPA standard that includes TKIP which improves upon WEP security by expanding the size of the encryption key (128 bits) and Initialization Vector (IV) (64 bits), increasing the number of keys in use, and supplying a message integrity check.

Additionally, with 802.1X implementations, the Radius server profiles can be assigned from within the Security Profile to leverage the existing 802.1X authentication.

To configure WPA security with the Web UI, click **Configuration > Security > Profile**. Click **Help** for option details. Note that you can configure **MIXED** WPA and WPA2 in release 3.6 and later.

Example CLI WPA Configuration

The following example creates the profile named *wpa-tkip* that enables WPA for Layer 2, sets the encryption mode to TKIP, and names the Radius server in the *main-auth* profile as the primary Radius authentication server.

```
default(config)# security-profile wpa-tkip
default(config-security)# allowed-l2-modes wpa
default(config-security)# encryption-modes tkip
default(config-security)# radius-server primary main-auth
default(config-security)# exit
default(config)# exit
default#
```

© 2012 Meru Networks, Inc.

Opportunistic PMK Caching for WPA

Opportunistic PMK caching allows the controller, acting as the 802.1X authenticator, to cache the results of a full 802.1X authentication so that if a client roams to any AP associated with that controller, the wireless client needs to perform only the 4-way handshake and determine new pair-wise transient keys. PMK caching is supported only for KDDI phones when using WPA with TKIP and 802.1X authentication.

The system automatically detects the KDDI phone using the KDDI Vendor ID and applies PMK caching if available.

From with the Security Profile configuration, enable or disable PMK caching for KDDI phones. This option is only available when WPA is chosen for L2 encryption.

To enable PMK caching, add the following line to the WPA Security Profile configuration:

```
default(config-security)# pmkcaching enabled
```

To disable PMK caching, execute the following command at the WPA Security Profile configuration:

```
default(config-security)# pmkcaching disabled
```

WPA PTK Rekey

The WPA PTK rekey exchange mechanism includes a configurable PTK rekey period. The default is set to 60 seconds and the allowable range is 0 to 65535 (60 minutes). Upon expiration of the PTK re-key period, the access point initiates a 4-way PTK exchange followed by a GTK exchange. After the Radius Session time-out, an 801.X exchange occurs followed by a PTK rekey exchange.

To configure the WPA PTK rekey period, from the Security Profile configuration, add the following commands (the rekey period is in seconds):

```
default(config-security)# allowed-l2-modes wpa
default(config-security)# radius-server primary server_name
default(config-security)# encryption-modes tkip
default(config-security)# rekey period 120
default(config-security)# no group-rekey interval
```

If the rekey period is configured for a WPA profile (and not for WPA-PSK), then during every rekey period the infrastructure initiates a WPA 4-way handshake and a 2-way group key handshake to the client.

With the WPA PTK rekey feature, whenever a rekey interval expires, the Access Point performs a 4-way key exchange. This exchange is **NOT** encrypted. Following this, the Access Point sends a broadcast key to the client. This key packet is encrypted.

To disable WPA PTK rekey, enter the following command from the Security Profile configuration:

```
default(config-security)# rekey period 0
```

 © 2012 Meru Networks, Inc.

WPA GTK Rekey

With the WPA GTK rekey feature, whenever the group-rekey interval expires, the Access Point sends a broadcast key to the client. This key packet is encrypted.

To configure the WPA GTK rekey period, from the Security Profile configuration, add the following command (the rekey period can be between 0 and 65535 seconds):

```
default(config-security)# group-rekey interval n
```

To disable WPA GTK rekey, enter the following command from the Security Profile configuration:

```
default(config-security)# no group-rekey interval
```

Example WPA-PSK Configuration

When setting the PSK key, use a key from 8 to 63 ASCII characters (the characters ! \ " ? must be escaped with the backslash (\) character; for example \! \?) or 64 hex characters (hex keys must be prefixed with “0x” or the key will not work).

The following example creates the profile named *wpa-psk* that enables WPA-PSK for Layer 2, sets the encryption mode to TKIP, and sets the preshared key to *theSecretKeyForMay22*.

```
default(config)# security-profile wpa-psk
default(config-security)# allowed-l2-modes wpa-psk
default(config-security)# encryption-modes tkip
default(config-security)# psk key theSecretKeyForMay22
default(config-security)# exit
default(config)# exit
default#
```

WPA/WPA-PSK Command Summary

The following commands are used to configure WPA2, WPA, WPA2-PSK, and WPA-PSK:

Table 7: Commands to Configure WPA/WPA2

Command	Purpose
allowed-l2-modes wpa2 | wpa2-psk | wpa | wpa-psk |clear	With 802.1X authentication, enables WPA2 or WPA; or for manual key exchange WPA2-PSK or WPA-PSK; or with the **clear** option sets the mode to open (disables WPA).
encryption-modes ccmp | tkip	Configures WPA2/CCMP or WPA/TKIP as the Security Profile cipher suite.

© 2012 Meru Networks, Inc.

Table 7: Commands to Configure WPA/WPA2

Command	Purpose
psk key *key*	Sets the key for a WPA2/PSK/WPA-PSK configuration. Assign one PSK per ESSID that uses this Security Profile. The *key* can be: • 64 hexadecimal characters (that is, 0-9,a-f, A-F). Example: 0xa0a1a2a3a4a5a6a7a8a9aaabac or 0x1234567890123456789abcdef... • 8 to 63 ASCII characters (the characters ! \ " ? must be escaped with the backslash (\) character; for example \! \?). Example: m6o0secret79ckey
radius-server primary *profile*	Specifies the Radius profile information that is used for the primary Radius server.
radius-server secondary *profile*	Specifies the Radius profile information that is used for the secondary Radius server.
8021x-network-initiation	Determines 802.1X initiation method. When enabled (default), the AP sends the first EAP packet (an EAP ID request) to the wireless station to start 802.1X after the wireless station completes 802.11 authentication and association to an 802.1X-enabled ESSID. With the command **no 8021x-network-initiation**, the wireless station sends an EAPOL Start packet to the AP to start the 802.1X exchange.
pmkcaching pmkcaching | disable	Enables or disables PMK caching.(WPA2/Mixed profiles only)
rekey period *n*	Sets the PTK rekey period. The default is set to 60 seconds and the allowable range is 60 seconds to 60 minutes. (WPA only)
[no] group-rekey interval *n*	Sets the GTK group rekey period. The default is set to 60 seconds and the allowable range is 0 - 65535 (WPA only)

Configure 802.11 WEP Encryption

The controller supports two WEP cypher suites: WEP128 and WEP64.

The key configuration parameters allow the setting of the mutually shared key and the choice of key slot positions from 1 to 4, as allowed by most user key configuration programs.

 © 2012 Meru Networks, Inc.

Example 802.11 WEP Configuration

The following example creates the profile named *wep-voice* that supports a static 128-bit WEP encryption for voice users. The static WEP key is defined as *voice* and uses the third key index position on a user station's WEP key definition.

```
default(config)# security-profile wep-voice
default(config-security)# allowed-l2-modes wep
default(config-security)# encryption-modes wep128
default(config-security)# static-wep key voice
default(config-security)# static-wep key-index 3
default(config-security)# exit
default(config)# exit
default#
```

802.11 WEP Command Summary

The following summarizes the commands that can be used to configure 802.11 WEP security.

Table 8: Commands to Configure 802.11 WEP Security

Command	Purpose
encryption-modes wep128|wep64	Sets the cipher suite to WEP128, or WEP64 respectively.
static-wep key *key*	Sets the WEP key: • For WEP64, also known as WEP or WEP40, the key is a 5-character ASCII (for example, 123de) or 10-character hex key (for example, 0x0123456789) (the 0x prefix must be entered). • For WEP128, the key must be 13 ASCII characters or 26 hex digits (the 0x prefix must be entered).
static-wep key-index *position*	Sets which WEP key is in use. *position* can be set from 1 to 4.
allowed-l2-modes wep | clear	Enables or disables 802.11 WEP security. The **clear** option sets the mode to open.

Checking a CLI Configuration

To view all Security Profiles currently configured, use the **show security-profile** command.

```
# sh security-profile
```

```
Profile Name                    L2 Mode        Data Encrypt Firewall
   Filter

default                         clear          none
captive-portal                  clear          none
wep                             wep            wep64
802.1x                          802.1x         wep128
wpa                             wpa            tkip
wpapsk                          wpa-psk        tkip
wpa2                            wpa2           ccmp
wpa2psk                         wpa2-psk       ccmp
        Security Profile Table(8)
```

To view the details of an individual Security Profile, use the **show security-profile** *profile-name* command.

```
default# show security-profile wpa-leap
Security Profile Table

Security Profile Name                                : wpa-leap
L2 Modes Allowed                                     : 802.1x
Data Encrypt                                         : none
Primary Radius Profile Name                          : ACS-87-8#
Secondary Radius Profile Name                        :
WEP Key ASCII:(default) 13 chars / 0x:26 chars       : *****
Static WEP Key Index                                 : 1
Re-Key Period (seconds)                              : 0
Enable Multicast Re-Key                              : off
Captive Portal                                       : disabled
802.1X Network Initiation                            : on
802.1x Termination                                   : PEAP, TTLS
Shared Key Authentication                            : off
Pre-shared Key (Alphanumeric/Hexadecimal)            : *****
Group Keying Interval (seconds)                      : 0
PMK Caching                                          : disabled
Key Rotation                                         : disabled
Reauthentication                                     : off
MAC Filtering                                        : off
Firewall Capability                                  : none
Firewall Filter ID                                   :
Security Logging                                     : off
```

Use the commands **show web login-page** and **show web custom-area** to find out what set of web pages are used for Captive Portal and WebAuth.

 © 2012 Meru Networks, Inc.

Policy Enforcement Module

The optional Policy Enforcement Module feature makes it possible to control network content by dropping/allowing traffic based on configured policies applied on a firewall tag associated with a user group. This includes Captive Portal users in release 3.7 and later.

Meru's firewall is generic, and can be used to prevent any subnet to subnet communication, for specific ports or all ports. With the Filter ID, we can also prevent any user from any SSID from accessing specific subnets.

The per-user firewall filtering is implemented either by:

- A Radius-returned *filter-id* attribute, that is created on the Radius server and assigned to users
- A configured *firewall filter-id* parameter that is part of the ESS profile configuration and is applied to clients associated with an ESS

For the Radius-based per-user firewall, the returned *filter-id* attribute is part of Access-Accept message returned for a user, and is used as the firewall tag. The filtering action is determined by the configured firewall polices for this firewall tag.

In the absence of a Radius configuration, a configured firewall tag in the ESS profile can be used for defining the filtering based on the configured firewall polices. In this case, all users connecting to a given ESS profile are allocated the same firewall tag as configured for the profile.

Note: For successful operation using a Radius configuration, the *Filter-id* attribute that is configured on the Radius Server must match that used on the controller. In some Radius Servers, a Filter ID must be created.

The policies that filter the traffic are created using the standard QoS **qosrule** configuration, and the inherent priorities and configuration parameters are described in detail in the Chapter 15, "Configuring Quality of Service," as well as in the **qosrule** entry in the *Meru System Director Command Reference*.

Configure Firewall Policies with the CLI

Begin the Policy Enforcement Module configuration by configuring a set of qosrule policies to manage the traffic.

The following example shows the creation of qosrule 200 as a policy for Firewall filter-id 1:

```
default# configure terminal
default(config)# qosrule 200 netprotocol 6 qosprotocol none
default(config)# netprotocol-match
default(config-qosrule)# dstport 80
default(config-qosrule)# dstport-match on
```

© 2012 Meru Networks, Inc.

```
default(config-qosrule)# action drop
default(config-qosrule)# firewall-filter-id 1
default(config-qosrule)# firewall-filter-id-match on
default(config-qosrule)# qosrule-logging on
default(config-qosrule)# qosrule-logging-frequency 30
default(config-qosrule)# exit
default(config)# exit
```

To check the configuration of the policy, use the **show qosrule** command:

```
default# show qosrule

ID    Dst IP          Dst Mask        DPort Src IP          Src Mask        SPort Prot QoS
   Action   Drop  Firewall Filter

1     0.0.0.0         0.0.0.0          1720  0.0.0.0         0.0.0.0         0     6
   h323  capture  head
2     0.0.0.0         0.0.0.0          0     0.0.0.0         0.0.0.0         1720  6
   h323  capture  head
3     0.0.0.0         0.0.0.0         5060  0.0.0.0         0.0.0.0         0     17   sip
   capture  head
4     0.0.0.0         0.0.0.0         0     0.0.0.0         0.0.0.0         5060  17   sip
   capture  head
7     0.0.0.0         0.0.0.0          5200  0.0.0.0         0.0.0.0         0     17
   none  forward  head
8     0.0.0.0         0.0.0.0          0     0.0.0.0         0.0.0.0         5200  17
   none  forward  head
200   0.0.0.0         0.0.0.0          80    0.0.0.0         0.0.0.0         0     6
   none  drop     tail  1
       QoS Rules(7 entries)
default#
```

The following commands are required to apply the example filter ID 1 to the Security Profile.

```
default(config-security)# firewall-capability configured
default(config-security)# firewall-filter-id  1
default(config-security)# security-logging off
```

Note: Once you create a firewall rule, you cannot modify the rule to enable or disable firewall logging. As a workaround, either create the firewall rule with the required option or delete the rule and re-apply it with the required option.

Troubleshooting Per-User Firewall

- Policy Enforcement Module license must already be installed.
- Turn on the QoS rule logging feature available in QoS rule page. If the client traffic hits the rule, the same will be displayed in the syslog server or via the CLI command **show syslog-file firewall**.

 © 2012 Meru Networks, Inc.

Proactive Spectrum Manager

Proactive Spectrum Manager, designed for single channel deployment, takes a top-level view into the channel spectrum, then recommends the best channels) for network operation. The PSM dashboard presents a goodness value for all channels and recommended channels of operation for the network using a chart with green (good) and red (don't use) bars.

Configure Proactive Dashboard Manager Using the Web UI

Use the dashboard to see the channel goodness over the spectrum and best available channels for 20MHz or channel-bonded (40MHz) operation on the 2.4 and 5GHz bands. The spectrum shows bar chart goodness values for all 20MHz and 40MHz channels. The higher the bar, the better the channel is. If the color of the bar is grey, no observation on that channel has taken place.

You have two PSM options, **View** and **Evaluate**.

View is enabled on all channels by default. View mode monitors interference, such as rogues, and displays recommendations for channel use. If you see solid green bands on every channel in the charts, either only View is enabled or Evaluate is also enabled and there are no rogues on any channels.

Evaluate is disabled on all channels by default. If you enable Evaluate mode on the channels, then PSM will manage the use of those channels by moving devices away from channels with a specified amount of rogue activity. To enable Evaluate:

1. Click **Monitor > Dashboard > Spectrum**.
2. Click **Evaluate** at the top of the screen.

   Optionally, select one of the options from the Evaluate drop-down list:

   View turns on rogue detection, does an immediate scan, turns off rogue detection, and then displays the results.

   One Time Adapt turns on rogue detection, does a scan, turns off rogue detection, and then moves stations to recommended channels immediately

   Periodic Adapt repeats at the interval you set in the minutes value. Every x minutes, it turns on rogue detection, does a scan, turns off rogue detection, and then moves stations to recommended channels immediately.
3. Optionally change the Evaluation Time from 120 seconds to a value of 5 - 300 seconds. Evaluation affects rogue scanning (turns it on for Evaluation Time seconds) and optionally changes channels.
4. Optionally change the Threshold from 25 to a value of 1 - 100 rogues. Threshold indicates a delta in goodness value between current and recommended channel that triggers a change of channel. Non-zero threshold applies to periodic adaptation.

© 2012 Meru Networks, Inc.

5. Optionally change the Adaption Interval from 30 to a value of either zero or 5 - 10080 seconds. (The values 1-4 seconds are not supported.) The adaptation interval determines how often channels can be automatically changed for this controller.
6. Click **Start Wizard**.
7. Confirm by clicking **OK** twice.

Click **Graph Help** to see what the chart colors mean. Click **Details** on either chart to see numeric values for the green bars in the charts. A summary of rogue scanning parameters is presented at the bottom of the screen. Also, the adaptation period of a periodic adaptation is shown if one is running. The view automatically refreshes every minute.

Note: If rogue detection is not enabled on the network, PSM turns it on when needed for evaluate mode, then turns it back off. For example, if you use the option **One Time Adapt**, PSM turns on rogue detection, does a scan and then moves stations to recommended channels immediately. This overwrites the running config and reboots the APs (save it to make it permanent).

Blacklisted channels are never recommended. RS4000 and mesh radios are not supported. The more non-Meru equipment on a channel, the lower the recommendation will be to use that channel. Do not use this feature with a multichannel configuration.

Configure Proactive Dashboard Manager Using the CLI

The CLI command for Proactive Dashboard Manager is **proactive-spectrum-manager evaluate**. This is an example:

```
mg-mc2# proactive-spectrum-manager evaluate
** Attention: Stations may be disconnected in this evaluation **
Are you absolutely sure [yes/No]? yes
Evaluation time [120s]? 10
View or Adapt [View/adapt]? adapt
Adaptation period [0] min (5-10080)? 0
```

For command details, see the *Meru System Director Configuration Guide*.

RSA SecurID Authentication

RSA SecurID is two-factor authentication mechanism. This authentication mechanism primarily involves three components:

- RSA SecurID Authenticator token (hardware based or software based) that generates a unique authentication code

 © 2012 Meru Networks, Inc.

- RSA SecurID Server (Authentication Manager)
- RSA Authentication Agent

RSA SecurID Authenticator Token and Code

Each RSA SecurID token includes a factory-encoded, unique ‘seed.’ The token uses this unique seed to generate an authentication code at fixed intervals (for example 60 seconds). By utilizing the built-in-clock time and the unique seed, the authentication code keeps changing at fixed intervals. Since the token's clock and the server's clock are synchronized. the server generates authentication codes at the same fixed intervals as the token. Possession of the resulting code is then combined with knowledge of a PIN number to produce secure authentication.

RSA SecurID Server

Users are authenticated against the RSA SecurID Server with the username and the passcode, which is the combination of the authentication code generated/displayed by the token and the PIN (see above).

The first time a user uses the token, they are asked to choose a new PIN. The server also requests a new time-synchronous PIN regularly or whenever the timing between a token and a server ‘drifts.’ If the drift is more than 3 minutes, then the Server requests the user to enter the next authentication code generated by the token in the next interval to verify the possession of the token. If the next authentication mode has the same clock drift, then token is assumed valid by the Server.

RSA SecurID Agent

This authentication is similar to the standard username-passcode authentication, but the passcode is not a single word. It is a numeric combination of the authentication code in the token and the PIN known to the user.

The RSA SecurID can be achieved two ways:

- EAP-RSA based authentication - implemented currently
- Native SecurID Authentication - not in use at this time

Configure RSA SecurID

Communication between an RSA server and a controller is the same as communication between a controller and any other radius server (IAS or Free radius). The only difference is in the way the client authenticates to the RSA Server, by means of two factor authentication in which Meru does not interfere. Configure an RSA server on a controller using the CLI command **radius-profile**. For example:

```
default# configure terminal
default(config)# radius-profile <RSA>
```

© 2012 Meru Networks, Inc.

```
default(config-radius)# ip-address <IP of the RSA server>
default(config-radius)# key secure-secret
default(config-radius)# exit
```

Configure MAC Filtering

MAC filtering controls a user station's access to the WLAN by permitting or denying access based on specific MAC addresses. A MAC address is unique to each IEEE 802-compliant networking device. In 802.11 wireless networks, network access can be controlled by permitting or denying a specific station MAC address, assigned to its wireless NIC card, from attempting to access the WLAN.

The Meru Wireless LAN System provides MAC filtering using the following methods:

- Locally on the Controller, through the administration of an Access Control List (ACL) that permits or denies access for specific stations based on their unique MAC addresses. Two ACLs are available for MAC filtering:
  - Permit ACL, which limits access to only those MAC addresses on the permit list
  - Deny ACL, which specifically disallows access to those addresses (clients) on the deny list

  Changes made to the local access/deny ACL are implemented in real time. For example, if a user currently on the WLAN is removed from the permit list, they are immediately dropped from the WLAN.
- Remotely, in conjunction with the Radius Server, which is configured to authorize access to a set of MAC addresses. The user authentication follows the procedure shown in **Radius Authentication**, but a MAC address is used for user validation.

  If the Controller Deny ACL is enabled, those addresses on the Deny list overrule MAC addresses on the Radius Server. Changes made to the MAC addresses on the Radius Server are not implemented in real time.
- Per ESS, which allows MAC filtering to be enabled or disabled in the associated Security Profile, overriding the MAC filtering setting on the controller, or on the Radius server.

The state that is set for the MAC filtering option determines the type of access control in use, with the precedence in the order of ESS Security Profile setting, local MAC filtering list, and then the Radius Server state:

- For Controller ACL administration, the valid states are:
  - **disabled**: (default) both the permit and deny ACLs are inactive, even if they contain MAC addresses
  - **permit**: permit ACL is enabled and deny ACL (if it exists) is disabled
  - **deny**: deny ACL is enabled and permit ACL (if it exists) is disabled
- For remote Radius Server administration, the valid states are:
  - **enabled**
  - **disabled**

 © 2012 Meru Networks, Inc.

The following table summarizes the controller/Radius Server settings.

	RADIUS Server Setting `disabled`	`enabled`
MAC Filtering `disabled`	no MAC filtering	RADIUS MAC filtering only
Permit ACL `enabled`	allow client in Permit list only	check Permit list first; if not in Permit list, check RADIUS server
Deny ACL `enabled`	Deny list used only	if not in Deny list, check RADIUS server

Configure MAC Filtering

MAC filtering can be set up for both the controller and the Radius Server. By default, MAC filtering is disabled. Enable MAC filtering before adding MAC addresses.To change the state of MAC filtering so that the permit list is enabled, use the command **`access-list state permit`** as follows:

```
controller(config)# access-list state permit

controller# show access-list state
MAC Filtering (ACL) Configuration

ACL Environment State : permit
Radius Profile name   :
Secondary Radius Profile Name   :
controller#
```

Add addresses to a permit ACL list by specifying them as command arguments, or by importing them from a prepared list. To add one or more MAC addresses to the permit access control list along with a brief description, type the following:

```
controller(config)# access-list permit 00:40:96:51:eb:2b 00:40:96:51:eb:22
controller(config-acl-permit)# descr MyClient
controller(config-acl-permit)# end
```

To import a list of MAC addresses to permit, create a text file listing all the MAC addresses, and import the text file. When creating the text file to be imported, only include one MAC address, in hexadecimal format (*xx*:*xx*:*xx*:*xx*:*xx*:*xx*), per line. For example, the contents of a text file to be imported might look like the following:

```
00:04:23:87:89:71
00:06:25:a7:e9:11
00:07:e9:15:69:40
00:0c:30:be:f8:19
00:0c:e6:09:46:64
```

© 2012 Meru Networks, Inc.

```
00:0c:e6:12:07:41
```

After creating the text file, transfer the file to the controller's /images directory. Use the CLI **copy** command to transfer the file to the controller. Check that the file has been copied using the **dir** command. The following example shows the command to import a text file named *acl* that adds the MAC addresses to the permit ACL list:

```
controller(config)# access-list permit import acl

00:04:23:87:89:71
00:06:25:a7:e9:11
00:07:e9:15:69:40
00:0c:30:be:f8:19
00:0c:e6:09:46:64
00:0c:e6:12:07:41
00:0c:e6:bd:01:05

Successfully Added : 7
Duplicate Entries  : 0
Invalid Format     : 0
Entries Processed  : 7
```

Configure a Deny MAC Filtering List

To set up a Deny MAC Filtering List, enable the ACL deny state and then either configure a Deny ACL or import a Deny ACL.

A Deny ACL takes precedence over Radius Server access, so you can use it to immediately deny access to a station or black-list certain clients (for example, if they have a virus or are attacking other devices).

By default, MAC filtering is disabled. To change the state of MAC filtering so that the deny list is enabled, use the command **access-list state deny** as follows:

```
controller(config)# access-list state deny

controller# show access-list state
MAC Filtering (ACL) Configuration

ACL Environment State : deny
Radius Profile Name   :
Secondary Radius Profile Name   :
controller#
```

Add client addresses to a deny ACL list by either specifying them as command arguments, or by importing them from a prepared list. This command specifies them as command arguments and enters a brief description:

```
controller(config)# access-list deny 00:40:96:51:eb:2b 00:40:96:51:eb:10
controller(config-acl-deny)# descr DenyStation
controller(config-acl-deny)# end
controller(config)#
```

 © 2012 Meru Networks, Inc.

To import a list of MAC addresses to deny, create a text file listing all the MAC addresses, and import the text file. When creating the text file to be imported, only include one MAC address, in hexadecimal format (*xx*:*xx*:*xx*:*xx*:*xx*:*xx*), per line. For example, the contents of a text file to be imported might look like the following:

```
00:04:23:87:89:71
00:06:25:a7:e9:11
00:07:e9:15:69:40
00:0c:30:be:f8:19
00:0c:e6:09:46:64
00:0c:e6:12:07:41
```

After creating a text file for import, transfer the file to the controller's /images directory using the CLI **copy** command. Ensure that the file has been copied using the **dir** command. Then, import the file.

The following example imports a text file named *denyacl* that adds the MAC addresses to the deny ACL list:

```
controller(config)# access-list deny import denyacl
00:04:23:87:89:71
00:06:25:a7:e9:11
00:07:e9:15:69:40
00:0c:30:be:f8:19
00:0c:e6:09:46:64
00:0c:e6:12:07:41

```

Configure a Remote Radius Server for MAC Filtering

When Radius Server MAC filtering is enabled, station MAC addresses are set up and managed by a remote Radius Server. When a new station attempts to join the WLAN, the Controller queries the Radius server with the MAC address to determine whether the client is permitted. If the Radius server does not respond, or responds that the client is not authorized, the client is blocked from entering the WLAN.

Radius Server configuration with the CLI is performed using the **radius-profile** command and submode where you specify the configuration profile for the primary (and optional secondary) Radius Server (includes IP address, secret key, port, and the delimiter used between MAC addresses in its authorization table).

The following command configures and enables the primary Radius server named in the profile *main-auth*:

```
controller(config)# access-list radius-profile primary main-auth
controller(config)#
```

© 2012 Meru Networks, Inc.

For more information on configuring a Radius profile, see “Configure 802.1X Radius Security With the CLI” on page 125.

Configure an ESS Profile for MAC Filtering

Control is provided per ESS via settings in its Security Profile to turn off or on global MAC Filtering settings. For example, if controller-based MAC filtering or if Radius Server MAC Filtering is enabled, the command **no macfiltering** disables those settings for the ESS. To enable global MAC filtering again, use the **macfiltering** command.

Security Certificates

Certificates provide security assurance validated by a Certificate Authority (CA). This chapter describes the process to obtain and use certificates. For a Custom Certificate to work properly, you must import not only the Server Certificate, but the entire chain of trust starting with the issuer certificate all the way up to the Root CA (see **Figure 16**).

Server certificates are generated based on a specific CSR (see **Figure 15**) and, along with the server certificate, you should get the entire chain of trust (see **Figure 16**).

Figure 15: Sample CSR Sent to CA

 © 2012 Meru Networks, Inc.

Figure 16: Sample Certificates Returned by CA (Server, Intermediate, and Root)

Note: Generate Certificate Signing Requests (CSR) directly on the controller using the Web UI.

Generate a CSR on a Controller

To create a Certificate Request, follow these steps from the controller that needs a certificate:

1. Click **Configuration > Certificate Management > Server Certificates**. The Server Certificate window displays.
2. Click **Add**. The Certificate Add window displays.
3. Provide the requested information in this window.
4. Click **Apply**.
   The CSR is generated and appears in a window.
5. Either copy this Certificate PEM for pasting into a submittal form or click **Save** to save the CSR as a file.
6. Click **Close**.
7. Send the CSR to the Certificate issuer to be processed. If the CA asks for the operating system type, select **Open SSL** (if available) or **Other**.

The Certificate entry now displays in the Server Certificates page under “Pending CSR.” This entry will be matched to the certificates when they arrive and imported, ensuring that the controller that requested certificates is the only one to use those certificates.

Import the Certificate

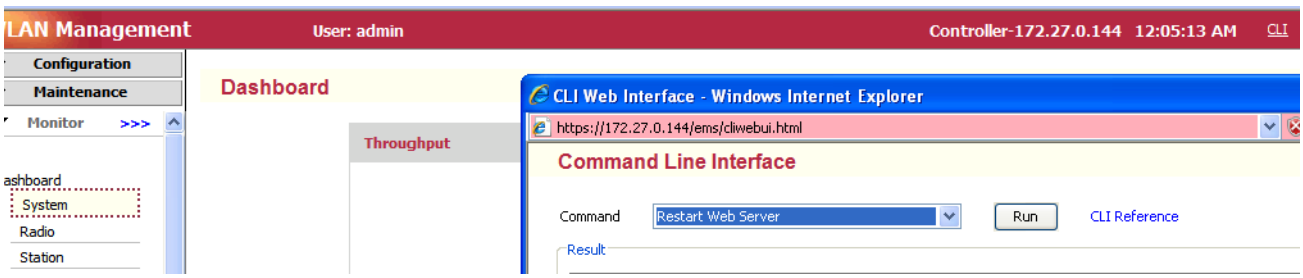
Remember that you MUST add the Root Certificate and ALL Intermediate Certificates in the chain of trust before you install the signed Server Certificate; if you don’t install in order, you get an error.

To import a Trusted Root CA and the entire chain of trust that you receive from a CA, follow these steps:

© 2012 Meru Networks, Inc.

1. Click **Configuration > Certificate Management > Trusted Root CA**
2. Click **Import**.
3. **Browse** to the Root CA file and select it.
4. Click **Open** and give the Certificate an appropriate alias name.
   You can also open the certificate in any text editor and copy/paste the Certificate's PEM text into the “Certificate PEM” blank text area shown below.
5. Click **Import**.
   You should see a message indicating that the import was successful.
6. Click **OK > Close**.
7. Repeat steps 2 - 6 for all certificates.
   You should now see all certificates imported into the controller
8. Import the Server Certificate by clicking **Configuration > Certificate Management > Server Certificates > Pending CSR > Import.**
9. Browse to the server certificate, select it and click **Import > Open > Import**.
10. Click **OK > Close > Close**.
11. Restart the web server by clicking **CLI** at the top right of the screen (see **Figure 17**), selecting **Restart Server**. and then clicking **Run**.

Figure 17: Accessing CLI from GUI



You are finished importing the certificates.

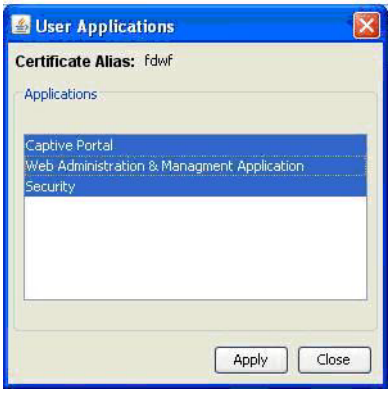
Assign a Server Certificate to an Application

Certificates can be used for security purposes (i.e., for radius termination) as well as by Captive Portal or Web Administration tools. To assign the Server Certificate:

1. Highlight the Certificate in the Server Certificates list.
2. Click **Used By**. The User Applications dialog displays.

 © 2012 Meru Networks, Inc.

Figure 18: Applications to Use Certificate



3. Click to select the Captive Portal or Web Administration & Management Application entry or shift-click to select both.
4. Click **Apply**.
5. Click **Close**.
6. To ensure that the certificate is applied and activated correctly, use the **reload-security** command from the system's CLI.

The Apache Web Server needs to be restarted after successfully assigning a certificate to be used by Captive Portal and/or Management Applications. Restart the Web Server with the Web CLI (top right corner of the Web Interface) and choosing "Restart Web Server" command.

Troubleshooting Certificates

.The following errors can occur during the certificate process.

Error Message	Why It Appeared	How to Correct Problem
Certificate file is not a valid x.509 certificate	Certificate file is corrupt or not a X.509 certificate (PEM/DER) file.	Navigate to a valid X.509 certificate file.
Certificate has expired or not yet valid	Certificates are valid for a specified number of days with Start Date (Valid From) and End Date (Valid To). This certificate is not valid at this time.	Make sure that the Certificates Start Date (Valid From) and End Date (Valid To) range is current. If the certificate Start Date is in future, then wait till that time to import the certificate. If the certificate has expired, then get another certificate issued by the CA.
Certificate alias name already exists	Another certificate with same alias name has already been imported.	Use a different alias name.

© 2012 Meru Networks, Inc.

Error Message	Why It Appeared	How to Correct Problem
Certificate already exists (with either same alias name or different alias name)	Certificate has already been imported.	Do nothing.
Certificate Public key verification failed	You selected an alias name that is different from the certificate's CSR alias name.	Select the alias name that you used when creating the CSR for this certificate.
Certificate's Issuers verification failed	The Issuers certificates (complete chain-of-trust) is not available in Trusted Root CA's list. The most common cause is that you tried to import an intermediate or server certificate first.	Import the Trusted Root CA certificates chain of trust first. Then import the Server Certificate.

© 2012 Meru Networks, Inc.

Chapter 9
Authentication

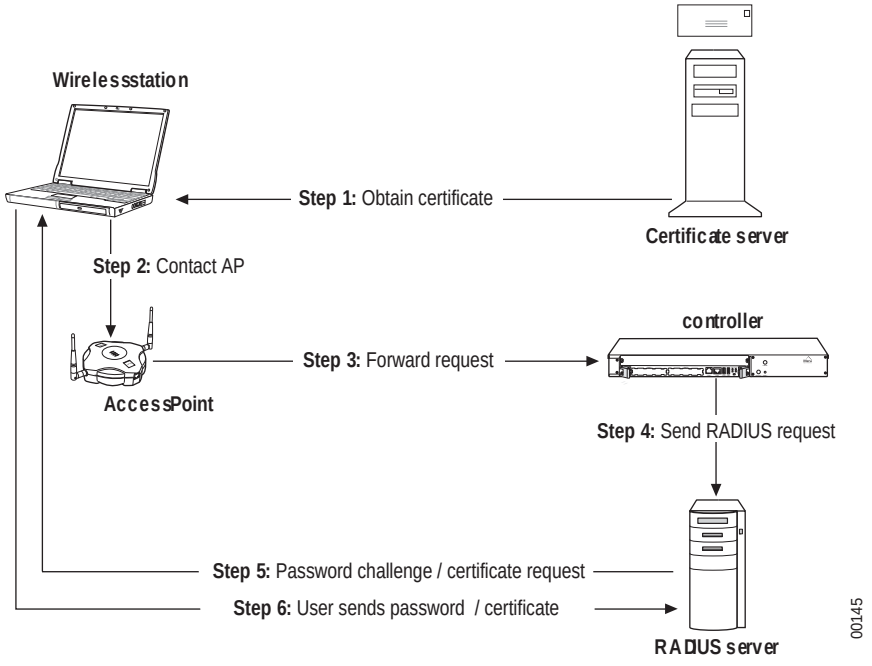
There are three authentication methods available for administrators and two methods available for users. Administrators can be authenticated with Radius, TACACS+ or Local authentication. Users can be authenticated with Radius or Local authentication.

Radius Authentication

Conceptual 802.1X Model for Radius Authentication

The conceptual model for 802.1X authentication looks like this:

Figure 19: Conceptual Model for 802.1X Radius Server Authentication



802.1X Radius authentication works like this:

1. Depending on the EAP type, you may first need to obtain a digital certificate from the Certificate Server.
2. Using EAP as end user, contact the AP in order to be authenticated.
3. The AP forwards the request to the controller.
4. The controller acts as a Radius client and sends the request to the Radius server.
5. Depending on the EAP type, the Radius server may challenge the end user for a password, or the user may present a digital certificate that they have previously obtained from a Certificate Server.
6. The Radius server authenticates the end user and the access point, and opens a port to accept the data from the end user.

Configure Radius Authentication for Users With the Web UI

Note: Radius Authentication requires Level 10 permission.

To use Radius authentication for guests and employees on the network, you first need to create a Radius Profile, then include that Radius Profile in a Security Profile, then include the Security Profile in an ESS Profile. Configuring Radius authentication for administrators is a different, simpler process. Follow these steps to add a Radius profile to System Director:

1. Click **Configuration > Security > Radius**.
2. Provide a name, IP address, secret key, and port number (**1812** is default).
3. Select a MAC address delimiter (**Hyphen**, **Single Hyphen** or **Colon**) from the list.
4. Select a password type (**Shared Key** or **MAC Address**) from the list.
5. Click **OK**.

Indicate when the Radius server should be used. There are two ways to do this. One way is a two-step process that creates a Security Profile to call the Radius Profile, and then creates an ESS Profile to call the Security Profile. This process is described in steps 6 and 7.

6. Click **Configuration > Security > Profile**. Here you see all security profiles that have been created on this controller. You can either modify an existing security profile to use the Radius server or you can add a new security profile. Either way, the security profile includes a drop-down list for Primary Radius Profile Name and Secondary Radius Profile Name; all configured Radius servers are listed and you can select one from the list.

Indicate which ESS Profile should use the Security Profile.

7. Click **Configuration > Wireless > ESS**. Here you see all ESS profiles that have been created on this controller. You can either modify an existing ESS profile to use the Security Profile or you can add a new ESS Profile. Either way, there is a drop-down list for Security Profile Name; all configured Security Profiles are listed and you can select one from the list.

 © 2012 Meru Networks, Inc.

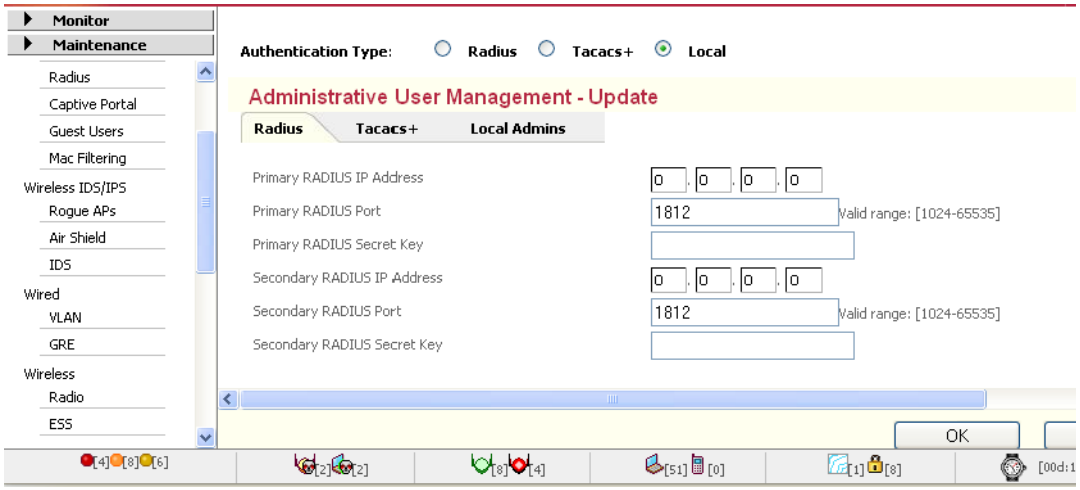
You can also skip step 6 above and select the Primary Radius Profile Name and Secondary Radius Profile Name directly from the ESS as part of step 7.

Configure Radius Authentication for Administrators With the Web UI

Configure Radius authentication for all administrators by following these steps:

1. Click **Configuration > User Management > Setup**.
2. Select Radius for Authentication Type at the top of the screen. See **Figure 21**.
3. There are three tabs for admin authentication (see m), **Radius**, **Tacacs+** and **Local Admins**. The **Radius** tab is the default.

Figure 20: Configure a User for Radius Authentication



4. Provide the IP address of the primary Radius server.
5. Provide a primary Radius port number; the default is **1812**.
6. Provide the secret key for Radius server access.
7. Optionally repeat steps 4, 5 and 6 for a secondary Radius server.
8. Click **OK**.

© 2012 Meru Networks, Inc.

9. Add administrators on the Radius server using these three levels.

1	**Operator** is the lowest authentication level and also the default. Operators can see statistics and results but cannot make any configuration changes.
10	**Administrators** can also do general configuration changes, but cannot upgrade APs or controllers, nor can they upgrade System Director versions using Telnet. The cannot configure an NMS server, NTP server, change the system password, date or time (all CLI). They cannot create admins nor can they set the authentication mode for a controller (GUI and CLI). Administrators cannot add or remove licensing.
15	**SuperUser** administrators can perform all configurations on the controller. They are the only ones who can upgrade APs or controllers and they can upgrade System Director versions using Telnet. The can configure an NMS server, NTP server, system password, date and time (all CLI). They can also create admins and set the authentication mode for a controller (GUI and CLI). Superusers can add and remove licensing.

Configure Radius Authentication for Administrators With the CLI

New commands to configure all controller administrators for Radius authentication mode were introduced in System Director 4.1:

- **authentication mode global**
- **primary-radius-ip**
- **primary-radius-port**
- **primary-radius-secret**
- **authentication type radius**
- **secondary-radius-ip**
- **secondary-radius-port**
- **secondary-radius-secret**

For command details, see the *Meru System Director Command Reference*.

CLI Example for Setting Authentication Mode to Radius

```
ramcntrl(0)# configure terminal
ramcntrl(0)(config)# authentication-mode global
ramcntrl(0)(config-auth-mode)# authentication-type radius
ramcntrl(0)(config-auth-mode)# primary-radius-
primary-radius-ip      primary-radius-port    primary-radius-secret
ramcntrl(0)(config-auth-mode)# primary-radius-ip 172.18.1.3
ramcntrl(0)(config-auth-mode)# primary-radius-secret RadiusP
ramcntrl(0)(config-auth-mode)# secondary-radius-
secondary-radius-ip     secondary-radius-port    secondary-radius-secret
```

 © 2012 Meru Networks, Inc.

```
ramcntrl(0)(config-auth-mode)# secondary-radius-ip 172.18.1.7
ramcntrl(0)(config-auth-mode)# secondary-radius-secret RadiusS
ramcntrl(0)(config-auth-mode)# exit
ramcntrl(0)(config)# exit
ramcntrl(0)# sh authentication-mode
Administrative User Management
AuthenticationType           : radius
Primary RADIUS IP Address    : 172.18.1.3

Radius Authentication Attributes

Attributes for 802.1X

The Radius 802.1X message attributes are:

MESSAGE: Access-Request

ATTRIBUTES:

- User-Name(1)
- NAS-IP-Adress(4)
- NAS-Port(5)
- Called-Station-Id(30) = <mac of Controller>:<ssid string>
- Calling-Station-Id(31)
- Framed-MTU(12)
- NAS-Port-Type(61) = Wireless-802.11(19)
- Connect-Info(77)
- Message-Authenticator(80)

OPTIONAL ATTRIBUTES (depends on EAP type):

- EAP-Message(79)
- State(24)

OPTIONAL ATTRIBUTES (depends on Radius based User Management)

© 2012 Meru Networks, Inc.

- Service-Type(6) = Value:Login(1)
- User-Password(2) = Value:<password string>

MESSAGE: Access-Accept

ATTRIBUTES:

- Framed-Protocol(7) = PPP(1)
- Service-Type(6) = Framed-User(2)
- Class(25)
- Message-Authenticator(80)

OPTIONAL ATTRIBUTES (depends on EAP type):

- EAP-Message(79)
- OPTIONAL ATTRIBUTES (required for Radius-assigned VLAN):
- Tunnel-Medium-Type(65) = 802(6)
- Tunnel-Type(64) = VLAN(13)
- Tunnel-Private-Group-Id (81) = <the VLAN ID>

OPTIONAL ATTRIBUTES (depends on Radius based User Management)

- Filter-Id(11) = Value:<Privilege Level>:<1-15>

Radius Accounting for Clients

If you have a Radius accounting server in your network, you can configure the controller to act as a Radius client, allowing the controller to send accounting records to the Radius accounting server. The controller sends accounting records either for clients who enter the wireless network as 802.1X authorized users or for the clients that are Captive Portal authenticated.

When using Radius accounting, set up a separate Radius profile for the Radius accounting server and point the ESS profile to that Radius profile. So, for example, you could have a Radius profile called radiusprofile1 that uses UDP port 1645 or 1812 (the two standard ports for Radius authentication) and your security profiles would point to radiusprofile1. To support Radius accounting, configure a new radius profile (like radiusprofile1_acct) even if the Radius accounting server is the same as the Radius authentication server. Set its IP and key appropriately and set its port to the correct Radius accounting port (1646, 1813 for example). Then point ESS profiles) to this new Radius profile radiusprofile1_acct.

Accounting records are sent for the duration of a client session, which is identified by a unique session ID. You can configure a Radius profile for the primary Radius accounting server and another profile for a secondary Radius accounting server, which serves as a backup should the primary server be offline. The switch to the backup Radius server works as follows. After 30 seconds of unsuccessful Primary Radius server access, the secondary Radius server becomes the default. The actual

 © 2012 Meru Networks, Inc.

attempt that made it switch is discarded and the next Radius access that occurs goes to the Secondary Radius server. After about fifteen minutes, access reverts to the Primary Radius Server.

In every Radius message (Start, Interim Update and Stop), the following attributes are included:

Table 9: Radius Accounting Attributes

Radius Attribute	Description
Session-ID	Client IP Address-Current Time - The session time returned from the radius server has priority. If the radius server doesn't return the session time, the configured value is used.
Status Type	Accounting Start/Accounting Stop
Authentication	Radius authentication
User-Name	Username
User-Name	Station Mac Address (station info)
NAS-IP Address	Controller IP Address
NASPort	Unique value (system generated)
Called Station-ID	Controller MAC Address
Called Station-ID	Controller MAC Address:ESSID Name (Used to enforce what ESS a station can connect to)
Calling Station-ID	Station MAC address
Connect Info	Radio Band of Station
Class	Class Attribute
NAS-Identifier	Any string to identify controller (self) in Access Request Packet. Min value 3 chars.
Acct-Input-Octets*	Number of octets received on this port (interface) and sent in Accounting-Request when Accounting status type is STOP

© 2012 Meru Networks, Inc.

Table 9: Radius Accounting Attributes

Radius Attribute	Description
Acct-Input-Packets*	Number of packets received on this port (interface) and sent in Accounting-Request when Accounting status type is STOP
Acct-Output-Packets*	Number of packets sent on this port (interface) and sent in Accounting-Request when Accounting status type is STOP
Acct-Output-Octets*	Number of octets sent on this port (interface) and sent in Accounting-Request when Accounting status type is STOP
Acct-Terminate-Cause	Used to get the reason for session termination and sent in Accounting-Request when Accounting status type is STOP
Acct-Delay-Time	Sent to indicate the number of seconds we have been waiting to send this record.
AP ID	Vendor specific info: the AP ID to which client connected. Sent when accounting starts
AP ID	Vendor specific info: the AP ID from which client disconnected from. Sent when accounting stops
AP Name	Vendor specific info: The AP Name to which client connected. Sent when accounting starts
AP Name	Vendor specific info: the AP ID from which client disconnected from. Sent when accounting stops
Session-Time	Number of seconds between start and stop of session

* Input-octets, output-octets, input-packets and output-packets are in Radius stop messages in 3.6, but those attributes are not included in Radius Interim Update messages.

Table 10: Radius Authentication Attributes

Radius Attribute	Description
User-Name	Username
NAS-IP-Address	Controller IP Address

 © 2012 Meru Networks, Inc.

Table 10: Radius Authentication Attributes

Radius Attribute	Description
NAS-Port	Unique value = essid << 11 | Sta AID
NAS-Port-Type	Type of the physical port used for authentication = 19
Called-Station-Id	Own MAC Address: ESSID Name
Called-Station-Id	Own MAC Address
Calling-Station-Id	STA MAC Address
Framed-MTU	Max Radius MTU = 1250
Connect-Info	Radio Band of Station
VLAN ID	Vlan Id of the ESS profile to which client is trying to connect. Only available for 802.1x clients and is sent only if its configured on the controller
Service-Type	Send the types of service requested = 8 (Authenticate Only)
Service-Type	Send the types of service requested = 1 (Login)
User-Password	User Password
Session-Timer	Number of seconds the user must be allowed to remain in the network
Class	Returned by Radius Server and to be sent in Accounting Request message
Vlan-Id	The Vlan ID returned by the Radius server
Filter-Id	Used with Per User Firewall (PEM); privilege level (1, 10, 15) sent as filter id in Radius response
Message-Authenticator	Returned by Radius server

© 2012 Meru Networks, Inc.

Table 10: Radius Authentication Attributes

Radius Attribute	Description
EAP Message	Returned by Radius server
Tunnel-Medium-Type	Indicates the transport medium like ipv4, ipv6. In CP, valid only if VPN is set. Also sent in Access-Request in case of CP.
Tunnel-Type	The type of tunnel, in our case should be VLAN i.e. 13. If anything else is received, treat as ACCESS-REJECT. In CP, valid only if VPN is set. Also sent in Access-Request in case of CP.
Tunnel-Private-Group	Receives the Vlan ID from this attribute (Does not apply for Captive Portal)
Framed-Compression	Indicates the compression protocol that is being used. In our case, NONE
Idle-Timeout	Use this to calculate client idle time and knock the client off.

Configure Radius Accounting for Captive Portal

See **Configure Radius Accounting for Captive Portal**.

Radius-Based ESS Profile Restriction

This feature gives a controller the capability to restrict wireless clients attempting connection through Radius based ESS profiles; the clients can connect only to certain SSIDs as returned in a Radius Accept message.

With this system, there is one Radius server and multiple ESS profiles with 802.1X security using this Radius Server. In absence of the RSSID feature, all wireless clients provisioned in the Radius Server have access to all ESS profiles and hence all associated VLANS. With SSID restriction, the Radius server can be further configured for each of these wireless clients specifying the SSIDs they can connect with.

You can use a Radius server to restrict SSID connection using VSA in the Radius Accept message. There are three possible conditions for an SSID:

Radius Server is sending:	Results in:
No list of acceptable SSIDs	Connection is accepted
A list of acceptable SSIDs that includes the ID	Connection is accepted

 © 2012 Meru Networks, Inc.

A list of acceptable SSIDs that does not include the ID	Connection is not accepted

The Radius server should return the allowed SSID(s) in a Vendor-specific attribute (VSA) with Vendor code 9 and attribute number 1 in the Access-Accept message. The attribute value should be string format.

The string should say **ssid=<ssid-string>** where <ssid-string> is replaced by the actual SSID (also known as the ESSID).

If a list of multiple allowed SSIDs is used, put each SSID in a separate instance of the attribute. The order of the attributes does not matter. If the SSID to which the station is trying to connect is not among the SSIDs returned by the Radius server, the station will be denied access.This feature has no CLI or Web UI commands associated with it. If the Radius responds with a list of allowed SSIDs, the list is used to process and limit the user.

TACACS+ Authentication

Terminal Access Controller Access-Control System Plus (TACACS+) is a remote authentication protocol that runs on a TACACS+ server on the network and is similar to Radius authentication. There are some differences between the two, however. Radius combines authentication and authorization in one user profile, while TACACS+ separates the two operations. Another difference is that TACACS+ uses TCP port 49 while RADIUS uses UDP port 1812. System Director 5.1 supports TACACS+ authentication but not accounting; System Director supports both Radius authentication and accounting. Only the Cisco ACS server is supported for Tacacs+ authentication.

The TACACS+ level required, 15 (superuser), 10 (admin), and 1 (user), for the activity on the current GUI window is listed in the Help. Click **Help** on any GUI window of System Director. In the CLI, all command lists also include the required authentication level, which is also now used for both Radius and local admin authentication in Release 5.1. TACACS+ actually provides eight levels, but Meru only uses the three authentication levels described here. The three levels used are described below:

1	**Operator** is the lowest authentication level and also the default. Operators can see statistics and results but cannot make any configuration changes.

© 2012 Meru Networks, Inc.

10	**Administrators** can also do general configuration changes, but cannot upgrade APs or controllers, nor can they upgrade System Director versions using Telnet. The cannot configure an NMS server, NTP server, change the system password, date or time (all CLI). They cannot create admins nor can they set the authentication mode for a controller (GUI and CLI). Administrators cannot add or remove licensing.
15	**SuperUser** administrators can perform all configurations on the controller. They are the only ones who can upgrade APs or controllers and they can upgrade System Director versions using Telnet. The can configure an NMS server, NTP server, system password, date and time (all CLI). They can also create admins and set the authentication mode for a controller (GUI and CLI). Superusers can add and remove licensing.

Configure TACACS+ Authentication Mode with the CLI

New commands to configure TACACS+ authentication mode for all administrators on a Cisco ACS server were introduced in System Director 4.1:

- **authentication mode global**
- **primary-tacacs-ip**
- **primary-tacacs-port**
- **primary-tacacs-secret**
- **authentication type tacacs+**
- **secondary-tacacs-ip**
- **secondary-tacacs-port**
- **secondary-tacacs-secret**

For command details, see the *Meru System Director Command Reference*.

CLI Example for Setting Authentication Mode to TACACS+

```
ramcntrl(0)# configure terminal
ramcntrl(0)(config)# authentication-mode global
ramcntrl(0)(config-auth-mode)# authentication-type tacacs+
ramcntrl(0)(config-auth-mode)# primary-tacacs-
primary-tacacs-ip      primary-tacacs-port    primary-tacacs-secret
ramcntrl(0)(config-auth-mode)# primary-tacacs-ip 172.18.1.5
ramcntrl(0)(config-auth-mode)# primary-tacacs-secret TacacsP
ramcntrl(0)(config-auth-mode)# secondary-tacacs-
secondary-tacacs-ip      secondary-tacacs-port    secondary-tacacs-secret
ramcntrl(0)(config-auth-mode)# secondary-tacacs-ip 172.18.1.10
ramcntrl(0)(config-auth-mode)# secondary-tacacs-secret TacacsS
ramcntrl(0)(config-auth-mode)# exit
ramcntrl(0)(config)# exit
ramcntrl(0)# sh authentication-mode
```

 © 2012 Meru Networks, Inc.

```
Administrative User Management
AuthenticationType           : tacacs+
Primary RADIUS IP Address    : 172.18.1.3
Primary RADIUS Port          : 1812
Primary RADIUS Secret Key    : *****
Secondary RADIUS IP Address  : 172.18.1.7
Secondary RADIUS Port        : 1812
Secondary RADIUS Secret Key  : *****
Primary TACACS+ IP Address   : 172.18.1.5
Primary TACACS+ Port         : 49
Primary TACACS+ Secret Key   : *****
Secondary TACACS+ IP Address : 172.18.1.10
Secondary TACACS+ Port       : 49
Secondary TACACS+ Secret Key : *****
ramcntrl(0)#
```

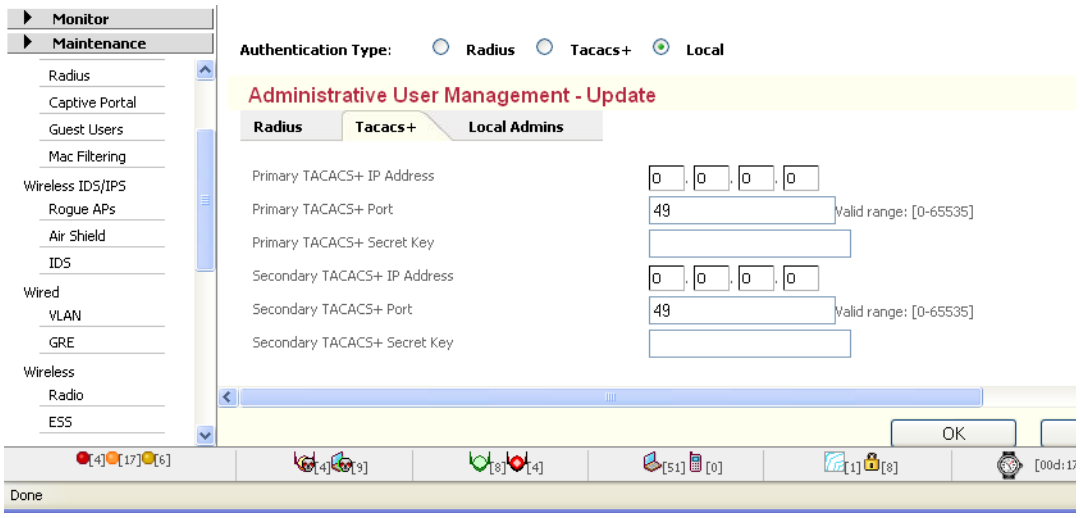
For command details, see the *Meru System Director Command Reference*.

Configure TACACS+ Authentication Mode with the Web UI

To configure TACACS+ authentication on a Cisco ACS server for all admins, follow these steps:

1. Click **Configuration > User Management > Setup**.
2. Select the Authentication Type **Tacacs** at the top of the screen.
3. There are three tabs for admin authentication (see **Figure 21**), **Radius**, **Tacacs+** and **Local Admins**. Click the **Tacacs+** tab.

Figure 21: Setting Authentication for Admins



4. Provide the IP address of the primary TACACS+ server.
5. Provide a primary TACACS+ port number; the default is 49.
6. Provide the secret key for TACACS+ server access.

© 2012 Meru Networks, Inc.

7. Optionally repeat steps 4, 5 and 6 for a secondary TACACS+ server.
8. Click **OK**.
9. Add administrators on the TACACS+ server using these three levels.

1	**Operator** is the lowest authentication level and also the default. Operators can see statistics and results but cannot make any configuration changes.
10	**Administrators** can also do general configuration changes, but cannot upgrade APs or controllers, nor can they upgrade System Director versions using Telnet. The cannot configure an NMS server, NTP server, change the system password, date or time (all CLI). They cannot create admins nor can they set the authentication mode for a controller (GUI and CLI). Administrators cannot add or remove licensing.
15	**SuperUser** administrators can perform all configurations on the controller. They are the only ones who can upgrade APs or controllers and they can upgrade System Director versions using Telnet. The can configure an NMS server, NTP server, system password, date and time (all CLI). They can also create admins and set the authentication mode for a controller (GUI and CLI). Superusers can add and remove licensing.

Local Admin Authentication

Local admin authentication takes place on the controller and uses the same three privilege levels as Radius and TACACS+, 15 (superuser), 10 (admin), and 1 (user). If administrators are using Local authentication, they cannot use Radius or TACACS+.

Configure an Admin for Local Authentication Mode With the CLI

Use these commands, new in release 4.1, to configure local administrators with the CLI:

- **authentication-mode global**
- **authentication-type local**
- **local-admin**
- **password**
- **privilege-level**
- **show local admins**

For command details, see the *Meru System Director Command Reference*.

```

Configure Local Authentication and Add an Admin with the Web UI

To configure Local authentication for admins and optionally add a local administrator, follow these steps:

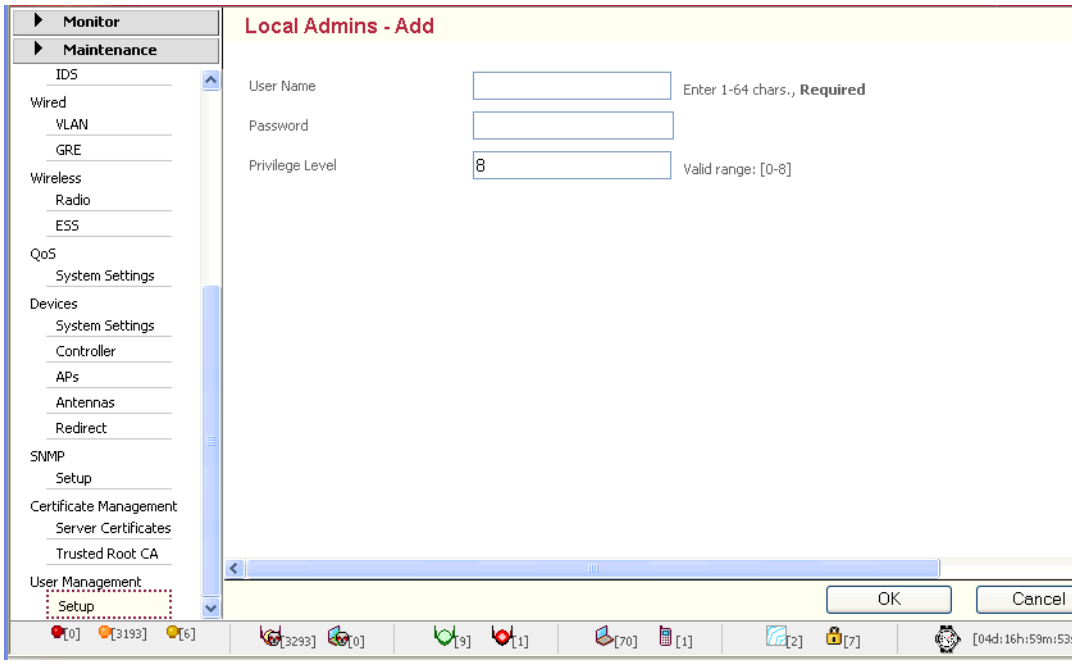
1. Click **Configuration > User Management > Setup**.
2. Select the **Local Admin** radio button at the top of the screen.

To actually add a local administrator, continue with Step 3.

3. There are three tabs for admin authentication (see **Figure 21**), **Radius**, **Tacacs+** and **Local Admins**. Click the **Local Admin** tab.
4. Click **Add**. The Local Admins - Add window displays - see **Figure 22**.

© 2012 Meru Networks, Inc.

Figure 22: Setting Local Authentication for Admins



5. Provide the user name for a local administrator.
6. Provide a password for that local administrator.
7. Enter a privilege level, **15** (Superuser), **10** (Admin), or **1** (Operator); see the descriptions for each level below.
8. Click **OK**.

 © 2012 Meru Networks, Inc.

802.1X Authentication

Authentication in the 802.11 standard is focused more on wireless LAN connectivity than on verifying user or station identity. For enterprise wireless security to scale to hundreds or thousands of users, an authentication framework that supports centralized user authentication must be used in addition to the WEP type specified by 802.11, or by using WPA/WPA2, which incorporates TKIP/CCMP-AES and 802.1X authentication.

The use of IEEE 802.1X offers an effective framework for authenticating and controlling user traffic to a protected network, as well as dynamically varying encryption keys if WPA/WPA2 is configured. 802.1X ties a protocol called EAP (Extensible Authentication Protocol) to both the wired and wireless LAN media and supports multiple authentication methods, such as token cards, Kerberos, one-time passwords, certificates, and public key authentication.

802.1X Components

There are three basic pieces to 802.1X authentication:

1. **Supplicant**—a software client running on the wireless station
2. **Authenticator**—the access point and the controller
3. **Authentication Server**—an authentication database, traditionally a Radius server such as Cisco ACS, Steel Belt Radius server (Juniper), or Microsoft IAS. In System Director release 4.1 and later, TACACS+ authentication is also supported.

Extensible Authentication Protocol (EAP) is used to pass the authentication information between the supplicant (the wireless station) and the authentication server (Radius, MS IAS, **TACACS+** or other). The actual authentication is defined and handled by the EAP type. The access point (and the controller in the configuration) acts as the authenticator. The authenticator is a client of the server that allows the supplicant and the authentication server to communicate.

About the EAP Types

The EAP type you choose, and whether you choose to implement authentication in your organization, depends on the level of security you require. Some of the most commonly deployed EAP authentication types include the following, all of which are supported by the controller:

- EAP-TLS
- EAP-PEAP
- EAP-TTLS
- Cisco LEAP

© 2012 Meru Networks, Inc.

EAP-TLS

EAP-TLS (Transport Layer Security) provides certificate-based mutual authentication between the client and the network. It relies on client and server certificates to provide authentication and can be used to dynamically generate user-based and session-based encryption keys to secure subsequent communications between the WLAN client and the access point. This type of authentication mechanism requires the administrator install a Certificate Server to store and distribute user and computer certificates. Each client will need the certificate to be downloaded and installed on the wireless client before attempting to use the WLAN. For a large WLAN installation, this can be a cumbersome task.

EAP-TTLS (Tunneled Transport Layer Security)

EAP-TTLS (Tunneled Transport Layer Security) was developed by Funk Software and Certicom, as an extension of EAP-TLS. This security method provides for certificate-based, mutual authentication of the client and network through an encrypted channel (or tunnel), as well as a means to derive dynamic, per-user, per-session encryption keys. Unlike EAP-TLS, EAP-TTLS requires only server-side certificates.

LEAP (Lightweight Extensible Authentication Protocol)

LEAP (Lightweight Extensible Authentication Protocol), is an EAP authentication type used primarily in Cisco Aironet WLANs. It encrypts data transmissions using dynamically generated WEP keys, and supports mutual authentication. Cisco has recently licensed LEAP to a variety of other manufacturers enabling the usage of other than Cisco adapters with LEAP.

PEAP (Protected Extensible Authentication Protocol)

PEAP (Protected Extensible Authentication Protocol) provides a method to securely transport authentication data, including legacy password-based protocols, via 802.11 wireless networks. PEAP accomplishes this by using tunneling between PEAP clients and an authentication server. Like the competing standard Tunneled Transport Layer Security (TTLS), PEAP authenticates wireless LAN clients using only server-side certificates, thus simplifying the implementation and administration of a secure wireless LAN. Microsoft, Cisco and RSA Security developed PEAP. Note that Cisco's LEAP authentication server, ACS, recently added support for PEAP.

802.1X EAP Types Feature/Benefit	MD5	TLS	TTLS	PEAP	LEAP
Client certificate required	no	yes	no	no	no
Server certificate required	no	yes	yes	yes	no
WEP key management	no	yes	yes	yes	yes

 © 2012 Meru Networks, Inc.

Provider	Microsoft	Microsoft	Funk	MS	Cisco
Authentication Attributes	One way	Mutual	Mutual	Mutual	Mutual
Deployment Difficulty	Easy	Difficult	Moderate	Moderate	Moderate
Wireless Security	Poorest	Highest	High	High	High

The following notes apply to the authentication mechanisms above:

1. MD5 is not typically used as it only provides one-way authentication. MD5 does not support automatic distribution and rotation of WEP keys and therefore does nothing to relieve the administrative burden of manual WEP key maintenance.
2. TLS, although very secure, requires the administrator to install client certificates on each wireless station. Maintaining a PKI infrastructure adds additional time and effort for the network administrator.
3. TTLS addresses the certificate issue by tunneling TLS, and thus eliminates the need for a certificate on the client side. This often makes TTLS the preferred option. Funk Software primarily promotes TTLS and there is a charge for supplicant and authentication server software.
4. LEAP has the longest history. Although previously proprietary to Cisco, Cisco now licenses the software. Other vendors are now beginning to support LEAP in their wireless LAN adapters.
5. The more recent PEAP works similar to EAP-TTLS in that it does not require a certificate on the client side. PEAP is backed by Cisco and Microsoft and is available at no additional cost from Microsoft. If you want to transition from LEAP to PEAP, Cisco's ACS authentication server runs both.

Chapter 10
Captive Portals for Temporary Users

If you want to give limited wireless access to a group of users, use Captive Portal. Captive Portal is a feature designed to isolate temporary users on a network, for example guests in a company or students using a library. If Captive Portal is enabled, the HTTP protocol over Secure Socket Layer (SSL, also known as HTTPS) provides an encrypted login interchange with the Radius server until the user is authenticated and authorized. During this interchange, all traffic with the CLIent station except DHCP, ARP, and DNS packets is dropped until access is granted. If access is not granted, the user is unable to leave the Captive Portal login page. If access is granted, the user is released from the Captive Portal page and is allowed to enter the WLAN. This section provides instructions to both implement Captive Portal and customize the GUI pages for Meru Captive Portal. Guest Login is disabled by default and requires privilege level 1 (lowest level). You can either **Configuring Meru Captive Portal** or use **Third-Party Captive Portal Solutions**.

Note: The Radius attributes for Dynamic VLAN assignment (Tunnel-Type, Tunnel-Medium-Type, and Tunnel-Private-Group-ID, see the command **vlan support**) are not supported and are ignored if returned as part of the Radius exchange.

Captive Portal does not support bridged profiles.

Security logging must be set to **on** before passthrough will work. Also, security logging has to be toggled of/on for any new settings to take effect.

Configuring Meru Captive Portal

To implement the built-in Captive Portal feature, complete these tasks (only two tasks are required). The Captive Portal configuration tasks are:

- **Optionally Customize and Use Your Own HTML Pages**
- **Configure Meru Captive Portal with the CLI** or **Configure Meru Captive Portal with the CLI**
- For authentication, either **Configure a Radius Server for Captive Portal Authentication** or **Create Meru Captive Portal Guest User IDs Locally**
- **Optionally Configure Pre-Authentication Captive Portal Bypass**

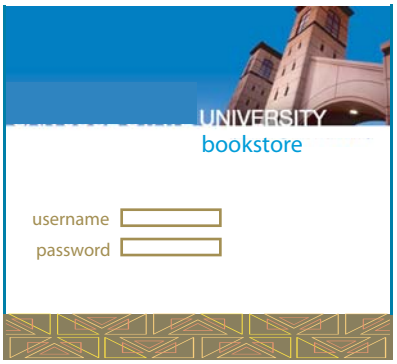
© 2012 Meru Networks, Inc.

Optionally Customize and Use Your Own HTML Pages

If you want to create custom Captive Portal login and success pages with your own logos and credentials, complete the directions in this section. You do not need to do this if you plan to use all of the default Captive Portal pages provided by Meru Networks (see login example in **Figure 23**). If you do want to create custom HTML pages, you can create up to four sets of Captive Portal custom login pages; these are referred to as Captive Portal 1 through 4. Each set has 6 files, but you can only create customized pages for the main login page and the authentication successful page. The remaining four HTML pages are always the default pages. If you create multiple custom files, they must both use the same authentication (Radius or Local) with up to 32 local users (the users can be different for each custom portal).

Figure 23: Default Captive Portal Login Page

Figure 24: Customized Captive Portal Login Page



Note: All Custom Portal pages (HTML, CSS, JS, and graphics) for the default pages and up to four sets of Custom Portal 2 pages that you create are all located in the same folder. This makes it imperative that you use unique names for all custom files. It also means that you can share a file such as a CSS file used for both CP1 and CP2 custom pages. This is also how and why any pages that you do not customize will use default HTML files. Here are the locations for the custom web portal files:

- /opt/meru/etc/ws/html.vpn.custom
- /opt/meru/etc/ws/Styles.vpn.custom
- /opt/meru/etc/ws/Images.vpn.custom

 © 2012 Meru Networks, Inc.

Create Custom Pages

The easiest way to create your own set of custom pages is to download Meru default files and use the two customizable ones (Login page and Success page) as templates, giving the two altered HTML pages new names. To do this, follow these steps:

1. Get the template files. Click **Maintenance > Captive Portal > Customization > Get Files**.

   A zip file called zip.tar.gz is downloaded to your computer. When the zip.tar.gz file is unzipped, you see the folder html.vpn that contains these six default files:
   - Login page can be customized (default filename is **loginformWebAuth.html)**
   - Successful login page can be customized (default filename is **auth_web_ok.html**)
   - Your login failed - try again page (default filename is **loginformWebAuthRetry.html**)
   - Web authentication succeeded; do you want to log off? (default filename is **logoff User.html**)
   - You are now logged off page (default filename is **loggedoff.html**)
   - Your logoff failed - try again page (default filename is **logoffUserFailed.html**)
2. You can only create two custom files per Captive Portal interface: a replacement for the Login page **loginformWebAuth.html** and a replacement for the Successful Login page **auth_web_ok.html.** Locate the two customizable HTML files on your computer and use them as templates to create your own custom HTML files. Use a program such as Notepad, make your changes, and then save the files with unique names.
   - CSS, JavaScript, and HTML are supported.
   - You can upload graphics up to 50K each in the formats .html .gif, .jpg, .png, .bmp .css, .js.

   To replace the first Meru logo graphic, look for the line that reads:
   src="Images.vpn/img_merulogo.gif" width=133 border=0></A></TD>
   Change the text "Images.vpn/img_merulogo.gif" to **"Images.vpn.custom/your_image.gif"** (Note that you are specifying a new directory for the .gif file, which is Images.vpn.custom).
   To replace the second graphic (the mountain), look for the line that reads:
   src="Images.vpn/img_aboutmeru.jpg" width=326 border=0></TD></TR>
   Change the text "Images.vpn/img_aboutmeru.jpg" to **"Images.vpn.custom/your_image2.gif"** (Note that you are specifying a new directory for the .gif file, which is Images.vpn.custom).

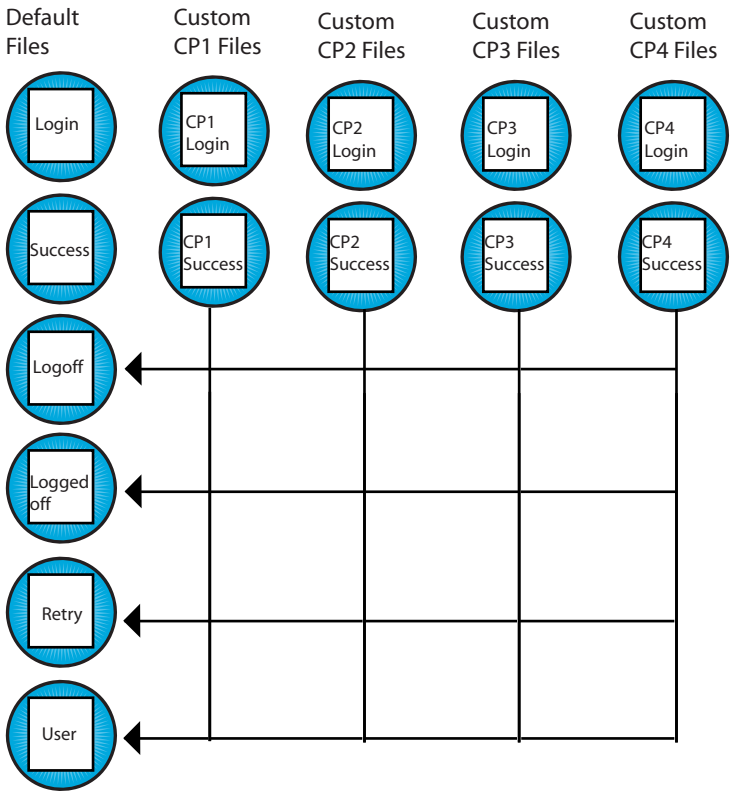
   Possible edits include changing logos, text, and formatting. The only lines that cannot be altered are the login communication process between the controller and the Radius server in the file **loginformWebAuth.html**.
3. Import all new Captive Portal files (HTML, CSS, JS, and graphics) to the controller one by one. Click **Maintenance > Captive Portal > Import File >** enter the location/file in the text box **> Import File**. Be sure that the files have unique names; they will all be placed in the same directory.
   Tell the controller to use custom pages. Click **Configuration > Captive Portal** and select the radio button **Customization**.

The custom HTML, CSS, JS, and graphic files are now on the controller.

© 2012 Meru Networks, Inc.

4. If you want to remove the word Meru or make any other changes in the four remaining files **loginformWebAuthRetry.html**, **logoff User.html**, **loggedoff.html, or logoffUserFailed.html**, alter the default files that you downloaded in Step 1 and import them as you did in Step 3. All five sets of Portal pages (default, CP1, CP2, CP3, and CP4) will then use the default files that you altered. These four files have only one version. See **Figure 25**.

Figure 25: Captive Portal HTML Pages (maximum)



Next, tell System Director which custom files to use under what circumstances. Either **Implement New Custom HTML Files Using the CLI** or **Implement New Custom HTML Files Using the GUI**.

Implement New Custom HTML Files Using the CLI

Implement custom Captive Portal pages with the CLI in System Director 3.7 and later by indicating which subset of users should see the new login and success pages; when a user logs in from this subnet, they will see the corresponding custom pages. You can implement up to two sets of Captive Portal pages at a time. For example, students in a library might see the Custom Captive Portal 1 login and success pages while visitors to the football stadium see the Custom Captive Portal 2 login and success pages. See **Figure 25**.

 © 2012 Meru Networks, Inc.

Determine who will see which pages. Point to two custom Captive Portal pages with the CLI command **web custom CaptivePortal[1|2] landing-file-name <***landing.html***> success-file-name <***success.html***>**. Then, point to the network or subnet for the custom captive portal pages with **web custom CaptivePortal[1|2] subnet <***x.x.x.x***> mask <***x.x.x.x***>**. For example:

```
MC3K-1# configure terminal
MC3K-1(config)# web custom ?
CaptivePortal1         Custom configuration for captive portal 1
CaptivePortal2         Custom configuration for captive portal 2
MC3K-1(config)# web custom captiveportal2 ?
landing-file-name  subnet
MC3K-1(config)# web custom CaptivePortal1 landing-file-name landing.html
   success-file-name success.html
MC3K-1 (config) web custom CaptivePortal1 subnet 1.1.1.0 mask
   255.255.255.0
MC3K-1(config)# exit
MC3K-1# show web ?
custom                 Displays IP range for captive portal custom mode.
custom-area            Lists the files in the custom area for web-auth and
   captive portal.
login-page             Displays the type of login page used for web-auth
   and captive portal.
MC3K-1# show web custom-area
Html Files
total 16
-rw-rw-rw-    1 root     root         2607 Jul 13 16:26 page2OK.html
-rw-rw-rw-    1 root     root         4412 Jul 13 16:26 page2LOGIN.html
-rwx------    1 root     root         2607 Jul 13 16:04 auth_web_ok.html
-rw-rw-rw-    1 root     root         4412 Jul 13 16:04
   loginformWebAuth.html
-rwx------    1 root     root            0 Jun 30 00:31 empty.html
Image Files
total 9
-rwx------    1 root     root            0 Jun 30 00:31 empty.gif
-rw-rw-rw-    1 root     root         8574 Oct 29  2008 Sample.jpg
MC3K-1# show web login-page
custom
```

Implement New Custom HTML Files Using the GUI

Implement custom Captive Portal pages with Web UI of System Director 3.7 and later by first directing Captive Portal to use custom HTML files; those HTML files will then reference the CSS, JS and graphic files you imported. Second, indicate which subset of users should see the new login and success pages by providing a subnet and a mask; when a user logs in from this subnet, they will see the corresponding custom pages. For example, students in a library might see the Custom Captive Portal 1 login page while visitors to the football stadium see the Custom Captive Portal 2 login page.

Direct Captive Portal to use custom HTML files by following these steps:

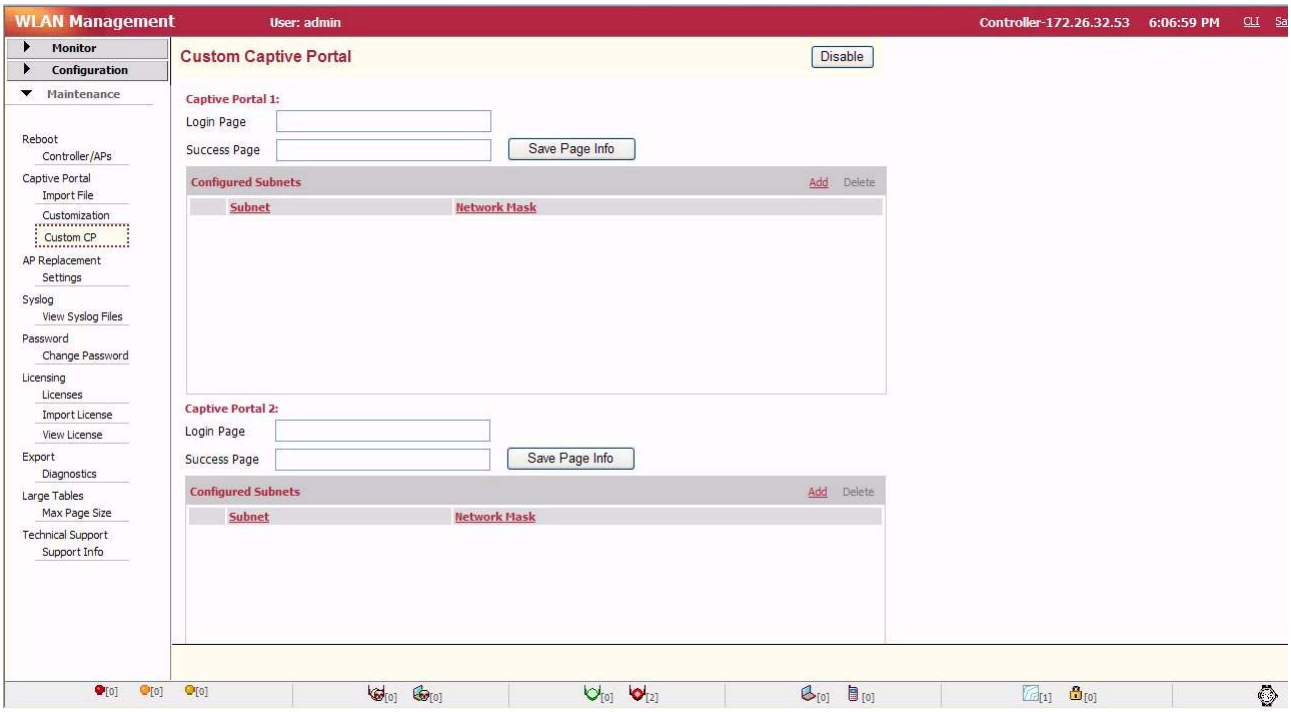
1. Click **Maintenance > Customization >** select a controller **> Change Mode**
2. Scroll down and select **Customized**.

© 2012 Meru Networks, Inc.

indicate which subset of users should see the custom pages by following these steps:

1. Make sure that security logging is set to **on** by clicking **Configuration > Security > Profile** and then selecting a security profile from the list. The security logging setting is near the bottom of the Security Profile Table. This setting must be set to **on** for Captive Portal configuration to work.
2. Click **Maintenance > Captive Portal > Custom CP**.
   The Custom Captive Portal page is displayed.

Figure 26: Custom Captive Portal Page



3. Provide the names of the new HTML Login Page and Success Page for CP1. Since they are on the controller now, you do not have to indicate a location. Click **Save Page Info**.
4. Provide at least one subnet location by clicking **Add**, providing a Subnet IP and a Network Mask, then clicking **OK**. Users logging in from this subnet will see these custom pages.
5. Create a corresponding Security Profile for this portal by clicking **Configuration > Security > Profile > Add**. Be sure that the setting for Captive Portal is set to **webauth** in this profile, then save it.
6. Click **Configuration > Security > Captive Portal**. In this window, identify the Radius server, whether or not to adjust the session, and idle timeouts. Session timeout and idle timeout are indicated in minutes.

 © 2012 Meru Networks, Inc.

Note: The L3 User Session Timeout field is used for specific clients that have issues in which they get de-authenticated upon entering sleep mode. This field specifies that the controller will retain these clients in memory for the specified number of minutes before the client is dropped from the captive portal authentication state.

7. Click **OK**.

The custom HTML files are now configured. You can configure up to four sets of custom files, Captive Portal 1, Captive Portal 2, Captive Portal 3, and Captive Portal 4; or, you can use the default files. See **Figure 25**.

Configure Meru Captive Portal with the CLI

- **radius-profile** defines the primary and secondary Captive Portal authentication servers.
- **accounting-radius-profile** defines the primary and secondary Captive Portal accounting servers.
- **captive-portal > activity-timeout** determines one timeout value. If a client is idle for this many seconds, the client is asked to reauthenticate.
- **captive-portal > session-timeout** determines one timeout value. If a client session lasts this long (seconds), the client is asked to reauthenticate.
- change_mac_state
- **ssl-server captive-portal-external-URL** directs Captive Portal to use a third-party solution located at the named URL.
- **captive-portal-auth-method** sets authentication to **internal** (default for Meru) or **external** for third-party solutions.

Captive Portal CLI Examples

This example configures Captive Portal with the CLI by completing these tasks:

- Create a guest user ID (Guest) and password.
- Enter the service start time (`01/01/2010 00:00:00`).
- Enter the service end time (`01/01/2011 00:00:00`).
- Show the Captive Portal.

```
MC3K-1(config)# guest-user ?
<guestname> Enter the name of the guest user.
MC3K-1(config)# guest-user Guest ?
<password> Enter the password of the guest user.
MC3K-1(config)# guest-user Guest XXXXX ?
<start-time> Enter the service start-time (mm/dd/yyyy hh:mm:ss) in double quotes.
MC3K-1(config)# guest-user Guest XXXXX "01/01/2010 00:00:00" ?
<end-time> Enter service end-time (mm/dd/yyyy hh:mm:ss) in double quotes.
MC3K-1(config)# guest-user Guest XXXXX "01/01/2010 00:00:00" "01/01/2011 00:00:00" ?
<CR>
MC3K-1(config)# guest-user Guest XXXXX "01/01/2010 00:00:00" "01/01/2011 00:00:00"
```

© 2012 Meru Networks, Inc.

```
MC3K-1(config)# exit
MC3K-1#
MC3K-1# show guest-user

Guest User  Name       Service Start Time              Service End Time
Guest                  01/01/2010 00:00:00             01/01/2011 00:00:00
        Guest User Table(1 entry)
```

The commands in this section show how to configure Captive Portal. The Radius server user configuration is performed separately, and is vendor-specific. (Check the Customer Service website for applicable Application Notes.) The Microsoft Internet Explorer and Netscape 7 browsers are both supported for the client application.

1. Create the Security Profile for the WebAuth Captive Portal:

```
default# configure terminal
default(config)# security-profile web_auth
default(config-security)# captive-portal webauth
default(config-security)# exit
default(config)# exit
```

2. Bind the web_auth Security Profile to an ESSID:

```
default# configure terminal
default(config)# essid WebAuth-meru-WIFI
default(config-essid)# security-profile web_auth
default(config-essid)# exit
```

3. Set the SSL server to use the primary Radius authentication server profile:

```
default(config)# ssl-server radius-profile primary main-auth
default(config)# end
```

4. Save the configuration:

```
default(config)# copy running-config startup-config
```

When users are authenticated, they can be moved into a corporate VLAN, and can have QosRules applied to their session. Each user will have a supplied default session timeout, which if nothing is supplied, will be the default of 33 minutes. If a user disconnects and connects back to same SSID on the same controller within 60 seconds, no re-authentication will be required.The session time returned from the radius server takes priority. If the radius server doesn't return the session time, configured values are used.

Create Meru Captive Portal Guest User IDs Locally

For authentication purposes, you can set up guest user IDs instead of using Radius authentication. (This is also a backup for Radius authentication; if Radius fails, this list is then used.) Releases 3.6 and later support user IDs. Be sure that the field Override Radius Configuration is set to **On** when using Guest IDs (click **Configuration** > **Security** > **Captive Portal**).

 © 2012 Meru Networks, Inc.

The guest user features of both releases are as follows.

Guest User Feature	Supported
Number of users	32
Add/delete users	yes
Change user's password	yes
Time of day login	yes
Day of month login	yes
Assigned to local administrators	yes

CLI Example - Create Guest User ID

This CLI example creates the guest user named Guest:

```
MC3K-1 configure terminal
MC3K-1(config)# guest-user ?
<guestname>            Enter the name of the guest user.
MC3K-1(config)# guest-user Guest ?
<password>             Enter the password of the guest user.
MC3K-1(config)# guest-user Guest XXXXX ?
<start-time>           Enter the service start-time (mm/dd/yyyy hh:mm:ss) in double
   quotes.
MC3K-1(config)# guest-user Guest XXXXX "01/01/2010 00:00:00" ?
<end-time>             Enter service end-time (mm/dd/yyyy hh:mm:ss) in double quotes.
MC3K-1(config)# guest-user Guest XXXXX "01/01/2010 00:00:00" "01/01/2011 00:00:00" ?
<CR>
MC3K-1(config)# guest-user Guest XXXXX "01/01/2010 00:00:00" "01/01/2011 00:00:00"
MC3K-1(config)# exit
MC3K-1#
MC3K-1# show guest-user

Guest User Name        Service Start Time           Service End Time
         Guest        01/01/2010 00:00:00          01/01/2011 00:00:00
        Guest User Table(1 entry)
MC3K-1#
```

There is an additional option for Local Authentication so that when local authentication for a Captive Portal user fails, Radius authentication is automatically checked; this option is called **Local and Radius**. From the Web UI, configure this by clicking **Configuration** > **Security** > **Captive Portal** > select an SSL Server > **Captive Portal Authentication Type** drop-down box (see below).

Figure 27: Local Captive Portal Authentication Has Two Options

The corresponding CLI command **ssl-server captive-portal authentication-type** configures the controller to use both local and radius authentication.

```
Controller(config)# ssl-server captive-portal authentication-type ?
local                  Set Authentication Type to local.
local-radius           Set Authentication Type to Local and Radius.
radius                 Set Authentication Type to radius.
```

Optionally Configure Pre-Authentication Captive Portal Bypass

Not all users or traffic types need to be authorized and authenticated by Captive Portal; users of VPN software can pass through the portal without authentication. To enable this passthrough firewall filter ID, follow these steps:

1. Click **Configuration > Security > Profile**.
2. Enter the name of the **Passthrough Firewall Filter ID.**
3. Click **Configuration > QoS > System Settings** to see the QosRule section of the Configuration menu (a license for PPF is required to enter the passthrough rules).
4. Add a rule. Remember that rules are stored in the order they are entered and can not be modified once they are entered.
5. At the bottom of the screen enter the **QoS Filter ID**.

 © 2012 Meru Networks, Inc.

The last entry in the filter should be a rule that drops all other traffic, so that traffic other than the passthrough will not be allowed to transverse the Captive Portal without authentication.

Captive Portal With N+1

Captive Portal changes are propagated in an Nplus1 environment as follows. When a slave takes over a master, it uses the master's Captive Portal pages. If changes are made on that active slave, that change is not automatically propagated to the master.

Troubleshooting Captive Portal

- The same subnet should not be entered for both CaptivePortal1 and CaptivePortal2. If you do this, only the CaptivePortal1 configured splash page will be displayed.
- Custom pages have to imported properly before making use of this feature. See **Optionally Customize and Use Your Own HTML Pages**.
- To check if the pages and images have been properly imported into the controller use the command **show web custom-area**
- To check if the imported page is coming up properly use the CLI https://<controller ip>/vpn/<page Name>
- To ensure that Captive Portal authentication is taking place, look at the access-accept message from the Radius server during Captive Portal authentication.
- Even when using custom CP pages, four default HTML files are used; only two are actually customized. The only way to change this is to alter the four default files which are used for both CP1 and CP2.
- The AP List is limited by space. If you exceed the space limit, the CLI command fails and the list of APs that you entered are lost.

Third-Party Captive Portal Solutions

Instead of using the Meru Captive Portal solution, you can use a third-party solution; you cannot use both. Companies such as Bradford, Avenda, and CloudPath all provide Captive Portal solutions that work with System Director 4.1 and later. There are two places that you need to indicate a third-party captive portal solution, in the corresponding Security Profile and in the Captive Portal configuration.

© 2012 Meru Networks, Inc.

Configure Third-Party Captive Portal With the Web UI

Indicate that a third-party Captive Portal solution will be used in the Security Profile by setting Captive Portal Authentication Method to **external**. For complete directions, see **Configure a Security Profile With the Web UI**.

Indicate that a third-party Captive Portal solution will be used in the Captive Portal configuration by setting Captive Portal External URL to the URL of the Captive Portal box:

1. Click **Configuration > Security > Captive Portal**.
2. Change the value for CaptivePortal External URL to the URL of the third-party box.
3. Click **OK**.

Configure Third-Party Captive Portal With the CLI

Indicate that a third-party Captive Portal solution will be used in the Security Profile with the CLI command **captive-portal-auth-method**. For example:

```
controller1# configure terminal
controller1(config)# security-profile CPExternal
controller1(config-security)# captive-portal-auth-method
external  internal
controller1(config-security)# captive-portal-auth-method ?
<captivePortAuthMethod> Configure captive portal authentication method.
     external        external
     internal        internal
controller1(config-security)# captive-portal-auth-method external
```

Indicate that a third-party Captive Portal solution will be used in the Captive Portal configuration with the CLI command **ssl-server captive-portal-external-URL**. Then, provide the URL for the Captive Portal box with the command **change_mac_state.** For example:

```
controller1# configure terminal
controller1(config)# ssl-server ca
captive-portal              captive-portal-external-URL
controller1(config)# ssl-server captive-portal-external-URL
controller1(config)# exit

controller1# change_mac_state ?
<ip-address>           Enter the Client IP Address.
controller1# change_mac_state 172.18.19.14 ?
off                    Web Auth mode off.
on                     Web Auth mode on.
controller1# change_mac_state 172.18.19.14 on ?
<CR>
<filter-id>            Enter the Filter Id.
controller1# change_mac_state 172.18.19.14 on ftp_only
```

 © 2012 Meru Networks, Inc.

```
<CR>
controller1# change_mac_state 172.18.19.14 on ftp_only
controller1#
controller1x# change_mac_state  172.18.19.14 ?
off                    Web Auth mode off.
on                     Web Auth mode on.
controller1# change_mac_state  172.18.19.14 off ?
<CR>
<filter-id>            Enter the Filter Id.
controller1# change_mac_state  172.18.19.14 off
controller1
```

Configure a Radius Server for Captive Portal Authentication

Configure a Radius Server with Web UI for Captive Portal Authentication

You can, for authentication purposes, set up the identity and secret for the Radius server in Meru Networks's System Director software. This takes precedence over any configured User IDs but if Radius accounting fails over, the local authentication guest user IDs are used. To do this, follow these steps:

1. Click **Configuration > Security > Radius** to access the Radius Profile Table.
2. Click **Add**.
3. Provide the Radius server information.
4. Save the configuration by clicking **OK**.
5. Enable a security profile for use with a Captive Portal login page by clicking **Configuration > Security > Radius > Add**.
6. Provide the required information, such as the name of the Radius profile. L2MODE must be **clear** to use Captive Portal. Set the Captive Portal to **WebAuth** and adjust any other parameters as required.

The identity and secret are now configured.

Configure a Radius Server with CLI for Captive Portal Authentication

The CLI command **ssl-server captive-portal authentication-type** configures the controller to use either **local** authentication, **Radius** authentication, or both. If **both** is selected, local authentication is tried first; if that doesn't work, Radius authentication is attempted.

© 2012 Meru Networks, Inc.

```
Controller(config)# ssl-server captive-portal authentication-type ?
local                  Set Authentication Type to local.
local-radius           Set Authentication Type to Local and Radius.
radius                 Set Authentication Type to radius.
```

The following example configures an authentication Radius profile named radius-auth-pri.

```
/* RADIUS PROFILE FOR AUTHENTICATION */
default# configure terminal
default(config)# radius-profile radius-auth-pri
default(config-radius)# ip-address 172.27.172.3
default(config-radius)# key sept20002
default(config-radius)# mac-delimiter hyphen
default(config-radius)# password-type shared-secret
default(config-radius)# port 1812
default(config-radius)# end
default#
default# sh radius-profile radius-auth-pri
Radius Profile Table
Radius Profile Name   : radius-auth-pri
Description           :
Radius IP             : 172.27.172.3
Radius Secret         : *****
Radius Port           : 1812
MAC Address Delimiter : hyphen
Password Type         : shared-secret
```

The following example configures a security Radius profile named radius-auth-sec.

```
default# configure terminal
default(config)# radius-profile radius-auth-sec
default(config-radius)# ip-address 172.27.172.4
default(config-radius)# key sept20002
default(config-radius)# mac-delimiter hyphen
default(config-radius)# password-type shared-secret
default(config-radius)# port 1812
default(config-radius)# end
default#
default# sh radius-profile radius-auth-sec
Radius Profile Table
Radius Profile Name   : radius-auth-pri
Description           :
Radius IP             : 172.27.172.4
Radius Secret         : *****
Radius Port           : 1812
MAC Address Delimiter : hyphen
Password Type         : shared-secret
```

Chapter 11
Rogue AP Detection and Mitigation

Rogue APs are unauthorized wireless access points. These rogues can be physically connected to the wired network or they can be outside the building in a neighbor's network or they can be in a hacker's parked car. Valid network users should not be allowed to connect to the rogue APs because rogues pose a security risk to the corporate network. Rogue APs can appear in an enterprise network for reasons as innocent as users experimenting with WLAN technology, or reasons as dangerous as a malicious attack against an otherwise secure network. Physical security of the building, which is sufficient for wired networks with the correct application of VPN and firewall technologies, is not enough to secure the WLAN. RF propagation inherent in WLANs enables unauthorized users in near proximity of the targeted WLAN (for example, in a parking lot) to gain network access as if they were inside the building.

Rogue detection and mitigation are currently supported on Meru access points as shown in the table below.

Table 11: Meru Support of Rogue Detection and Mitigation

	Rogue Detection	Rogue Mitigation
AP300	3.4.2 and later	3.7 and later
AP1000	4.1 and later	4.1 and later
AP400	4.2 and later	4.2 and later
AP150	3.6.1 and later	3.6.1 and later
OAP180	3.6.1 and later	3.6.1 and later
RS4000	3.6.1	3.6.1

Regardless of why a rogue AP exists on a WLAN, it is not subject to the security policies of the rest of the WLAN and is the weak link in an overall security architecture. Even if the person who introduced the rogue AP had no malicious intent, malicious activity can eventually occur. Such malicious activity includes posing as an authorized access point to collect security information that can be used to further exploit the network. Network security mechanisms typically protect the network from unauthorized users but provide no means for users to validate the authenticity of the network itself. A security breach of this type can lead to the collection of personal information, protected file access, attacks to degrade network performance, and attacks to the management of the network.

© 2012 Meru Networks, Inc.

To prevent clients of unauthorized APs from accessing your network, enable the options for both scanning for the presence of rogue APs and mitigating the client traffic originating from them. These features are set globally from either the CLI or Web UI, with the controller managing the lists of allowable and blocked WLAN BSSIDs and coordinating the set of APs (the mitigating APs) that perform mitigation when a rogue AP is detected.

As a result of the channel scan, a list of rogue APs is compiled and sent by the controller to a number of mitigating APs that are closest to the rogue AP. Mitigating APs send mitigation (deauth) frames to the rogue AP where clients are associated to remove those clients from the network. This presence of the rogue AP generates alarms that are noted on the Web UI monitoring dashboard and via syslog alarm messages so the administrator is aware of the situation and can then remove the offending AP or update the configuration list.

Rogue Scanning can be configured so that it is a dedicated function of a radio on a dual radio AP or a part time function of the same radio that also serves clients. When rogue AP scanning (detection) is enabled, for any given period, an AP spends part of the time scanning channels and part of the time performing normal AP WLAN operations on the home channel. This cycle of scan/operate, which occurs on a designated AP or an AP interface without assigned stations, ensures there is no network operation degradation.

For AP300/AP400 and AP1000, each radio is dual band (supports both 2.4GHz and 5.0GHz) and capable of scanning for all channels and all bands when configured as a dedicated scanning radio. For AP150, each radio is single band and scans only the band it's designed for. As access points are discovered, their BSSID is compared to an AP access control list of BSSIDs. An access point might be known, blocked, or nonexistent on the access control list. A “known” AP is considered authorized because that particular BSSID was entered into the list by the system administrator. A “selected” AP is blocked by the Meru Wireless LAN System as an unauthorized AP. The Meru WLAN also reports other APs that are not on the access control list; these APs trigger alerts to the admin console until the AP is designated as known or selected in the access control list. For example, a third party BSS is detected as a rogue unless it is added to the access control list.

Meru APs also detect rogue APs by observing traffic either from the access point or from a wireless station associated to a rogue. This enables the system to discover a rogue AP when the rogue is out of range, but one or more of the wireless stations associated to it are within range.

The following topics are covered in this chapter:

- **Configuring Rogue AP Mitigation with Web UI**
- **Configuring Rogue AP Detection Using the CLI**
- **Modifying Detection and Mitigation CLI Settings**
- **Troubleshooting Rogue Mitigation**

 © 2012 Meru Networks, Inc.

Configuring Rogue AP Mitigation with Web UI

To prevent clients of unauthorized APs from accessing your network, enable the options for both scanning for the presence of rogue APs and mitigating the client traffic originating from them. These features are set globally, with the controller managing the lists of allowable and blocked WLAN BSSIDs and coordinating the set of APs (the Mitigating APs) that perform mitigation when a rogue AP is detected.

When rogue AP scanning (detection) is enabled, for any given period, the AP spends part of the time scanning channels (determined by the setting Scanning time in ms), and part of the time performing normal AP WLAN operations on the home channel (determined by the setting Operational time in ms). This cycle of scan/operate repeats so quickly that both tasks are performed without noticeable network operation degradation.

The channels that are scanned by a particular AP are determined by the model of the AP. As a result of the channel scan, a list of rogue APs is compiled and sent by the controller to a number of Mitigating APs that are closest to the rogue AP. Mitigating APs send mitigation (deauth) frames to the rogue AP where clients are associated to remove those clients from the network. This presence of the rogue AP generates alarms that are noted on the Web UI monitoring dashboard and via syslog alarm messages so the administrator is aware of the situation and can then remove the offending AP or update the configuration list.

As well, if a rogue device seen on the wired interface of the AP and if the device is in the AP's discovered list of stations a wired rogue notification will be sent via the Web UI monitoring dashboard and syslog alarm message. If the rogue client is associated with the AP, that client is also classified as a rogue.

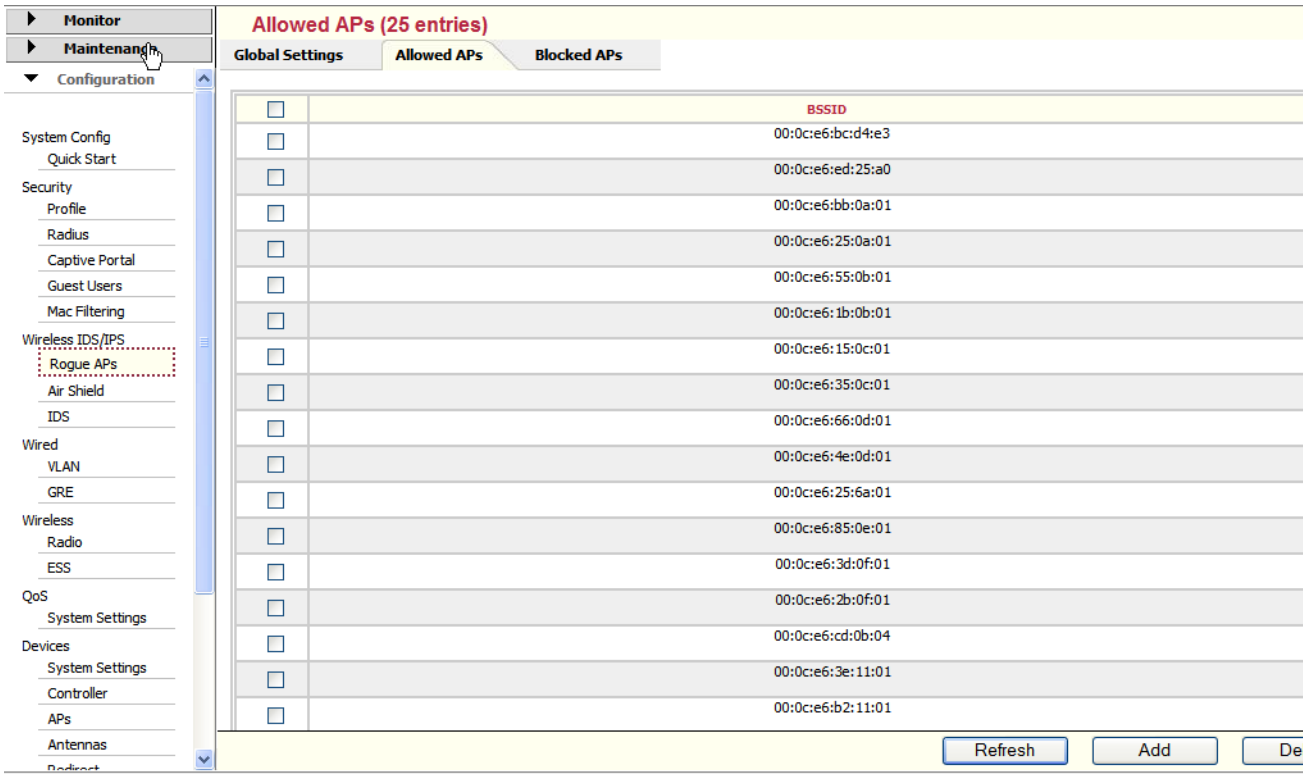
Alter the List of Allowed APs with the Web UI

To change the list of allowed APs, follow these steps:

1. From the Web UI, click **Configuration > Wireless IDS/IPS > Rogue APs > Allowed APs**.
   The Allowed APs screen appears. See **Figure 28**.

Figure 28: Web UI List of Allowed APs



2. To add a BSSID to the list, click **Add**.
   a. In the BSSID boxes, type the BSSID, in hexadecimal format, of the permitted access point.
   b. To add the BSSID to the ACL, click **OK**.
3. To delete a BSSID from the list, select the BSSID, click **Delete**, and then **OK.**

Alter the List of Blocked APs with the Web UI

To change the list of allowed APs, follow these steps:

1. From the Web UI click **Configuration > Wireless IDS/IPS > Rogue APs > Blocked APs**. The table shows information about access points listed as blocked BSSIDs in the access control list (ACL).
2. To see an updated list of the APs blocked in the WLAN, click **Refresh**.

 © 2012 Meru Networks, Inc.

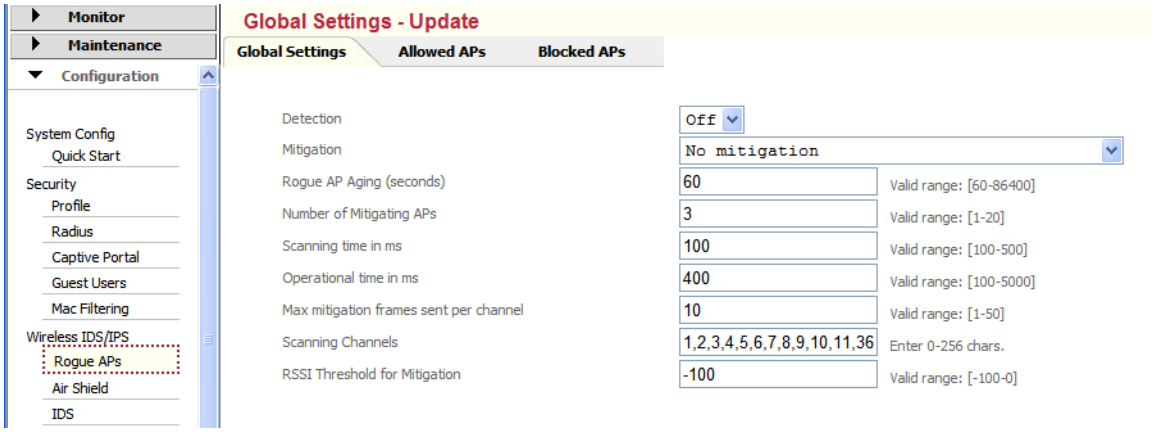
3. To add an AP to the blocked list, click **Add.**
   a. In the BSSID box, type the BSSID, in hexadecimal format, of the access point.
   b. Add the BSSID to the ACL, by clicking **OK**.
4. The blocked BSSID now appears on the list with the following information:
   - **BSSID** The access point's BSSID.
   - **Creation Time** The timestamp of when the blocked AP entry was created.
   - **Last Reported Time** The time the AP was last discovered. If this field is blank, the AP has not been discovered yet.
5. To remove a blocked BSSID from the ACL, select the checkbox of the blocked AP entry you want to delete, click **Delete**, and then click **OK**.

Configure Scanning and Mitigation Settings with the Web UI

To configure rogue AP scanning and mitigation settings, follow these steps:

1. From the Web UI click **Configuration > Wireless IDS/IPS > Rogue APs**.
   The Rogue AP screen appears with the Global Settings tab selected. See **Figure 29**.

Figure 29: Web UI Rogue AP Global Settings



2. In the Detection list, select one of the following:
   - **On**: Enables scanning for rogue APs.
   - **Off**: Disables rogue detection.
3. In the Mitigation list, select one of the following:
   - **No mitigation**: No rogue AP mitigation is performed.
   - **Block all BSSIDs that are not in the ACL**: Enables rogue AP mitigation of all detected BSSIDs that are not specified as authorized in the Allowed APs list.
   - **Block only BSSIDs in blocked list**: Enables rogue AP mitigation only for the BSSIDs that are listed in the Blocked APs list.
   - **Block Clients seen on the wire**: Enables rogue mitigation for any rogue station detected on the wired side of the AP (the corporate network, in many cases). When **Block clients seen on the wire** is selected, clients seen on the corporate

© 2012 Meru Networks, Inc.

network are mitigated. When **Block clients seen on the wire** is selected and the BSSID of the wired rogue client is entered in the blocked list (see **Alter the List of Blocked APs with the Web UI**) only listed clients are mitigated.

4. In the Rogue AP Aging box, type the amount of time that passes before the rogue AP alarm is cleared if the controller no longer detects the rogue. The value can be from 60 through 86,400 seconds.
5. In the Number of Mitigating APs text box, enter the number of APs (from 1 to 20) that will perform scanning and mitigation of rogue APs.
6. In the Scanning time in ms text box, enter the amount of time Mitigating APs will scan the scanning channels for rogue APs. This can be from 100 to 500 milliseconds.
7. In the Operational time in ms text box, enter the amount of time Mitigating APs will spend in operational mode on the home channel. This can be from 100 to 5000 milliseconds.
8. In the Max mitigation frames sent per channel text box, enter the maximum number of mitigation frames that will be sent to the detected rogue AP. This can be from 1 to 50 deauth frames.
9. In the Scanning Channels text box, enter the list of channels that will be scanned for rogue APs. Use a comma separated list from 0 to 256 characters. The complete set of default channels are 1,2,3,4,5,6,7,8,9,10,11,36,40,44,48,52,56,60,64,149,153,157,161,165.
10. In the RSSI Threshold for Mitigation text box, enter the minimum threshold level over which stations are mitigated. The range of valid values is from to -100 to 0.
11. Click **OK**.

Configuring Rogue AP Detection Using the CLI

These CLI commands configure rogue detection; for a complete explanation of the commands, see the *Meru System Director Command Reference*.

 © 2012 Meru Networks, Inc.

Table 12: CLI Commands for Configuring Rogue Detection

Rogue Detection Command	Action
rogue-ap acl	Adds to list of allowed BSSIDs
rogue-ap blocked	Adds to list of blocked BSSIDs
show rogue-ap globals	Displays current rogue data.
rogue-ap scanning-time	Configures time spent scanning channels
rogue-ap operational-time	Configures time spent performing normal AP WLAN operations on the home channel

Configuring the AP Access and Block Lists with the CLI

The feature uses an Access Control List (ACL) containing a list of allowed BSSIDs and a list of Blocked BSSIDs. By default, all Meru ESS BSSIDs in the WLAN are automatically included in the allowed ACL. A BSSID cannot appear in both lists.

To add an access point with a BSSID of 00:0e:cd:cb:cb:cb to the access control list as an authorized access point, type the following:

```
controller (config)# rogue-ap acl 00:0e:cd:cb:cb:cb
controller (config)#
```

To see a listing of all BSSIDs on the authorized list, type the following:

```
controller# show rogue-ap acl
Allowed APs

BSSID

00:0c:e6:cd:cd:cd
00:0e:cd:cb:cb:cb
```

A BSSID cannot be on both the blocked list and the access list for rogue AP detection at the same time. Suppose 00:0c:e6:cd:cd:cd is to be placed on the blocked list. If this BSSID is already on the authorized list, you must remove the BSSID from the authorized list, and then add the BSSID to the blocked list, as follows:

```
controller (config)# no rogue-ap acl 00:0c:e6:cd:cd:cd
controller (config)#
controller (config)# rogue-ap blocked 00:0c:e6:cd:cd:cd
controller (config)# exit
controller# show rogue-ap acl
Allowed APs

BSSID

00:0e:cd:cb:cb:cb
controller# show rogue-ap blocked
BssId              Creation Date   Last Reported
```

```
-----------------   --------------  --------------
00:0c:e6:cd:cd:cd   11/02 01:05:54   11/02 01:06:20
```

The commands to enable and confirm the rogue AP detection state are as follows:

```
controller (config)# rogue-ap detection
controller# show rogue-ap globals
Global Settings

Detection                              : on
Mitigation                             : none
Rogue AP Aging (seconds)               : 60
Number of Candidate APs                : 3
Number of Mitigating APs               : 5
Scanning time in ms                    : 100
Operational time in ms                 : 400
Max mitigation frames sent per channel : 10
Scanning Channels                      :
   1,2,3,4,5,6,7,8,9,10,11,36,40,44,48,52,
56,60,64,149,153,157,161,165
RSSI Threshold for Mitigation          : -100
```

Use the CLI command **show rogue-ap-list** to display all rogue clients and APs in the network.

Rogue Mitigation Example

Rogue AP mitigation for APs in the blocked list is enabled and confirmed as follows:

```
controller# configure terminal
controller (config)# rogue-ap detection
controller (config)# rogue-ap mitigation selected
controller (config)# exit
controller# show rogue-ap globals
Global Settings

Detection                              : on
Mitigation                             : selected
Rogue AP Aging (seconds)               : 60
Number of Candidate APs                : 3
Number of Mitigating APs               : 5
Scanning time in ms                    : 100
Operational time in ms                 : 400
Max mitigation frames sent per channel : 10
Scanning Channels                      :
   1,2,3,4,5,6,7,8,9,10,11,36,40,44,48,52,
56,60,64,149,153,157,161,165
RSSI Threshold for Mitigation          : -100
```

 © 2012 Meru Networks, Inc.

Modifying Detection and Mitigation CLI Settings

The default settings that are configured for the rogue AP detection and mitigation features are adequate for most situations. However, many default settings can be changed if your network requires lighter or heavier scanning and/or mitigation services. The following is the list of **rogue-ap** commands:

```
controller (config)# rogue-ap ?
acl                    Add a new rogue AP ACL entry.
aging                  Sets the aging of alarms for rogue APs.
assigned-aps           Number of APs assigned for mitigation.
blocked                Add a new rogue AP blocked entry.
detection              Turn on rogue AP detection.
min-rssi               Sets RSSI Threshold for Mitigation.
mitigation             Set the rogue AP mitigation parameters.
mitigation-frames      Sets the maximum number of mitigation frames sent
   out per channel.
operational-time       Sets the APs time on the home channel during
   scanning.
scanning-channels      Sets the global Rogue AP scanning channels.
scanning-time          Sets the APs per channel scanning time
```

As a general rule, unless the AP is in dedicated scanning mode, the more time that is spent scanning and mitigating, the less time is spent by the AP in normal WLAN operating services. Some rules determine how service is provided:

- The controller picks the APs that will scan and mitigate; those that mitigate are dependant on their proximity to the rogue AP and the number of mitigating APs that have been set.
- To preserve operational performance, APs will mitigate only the home channel if they have clients that are associated.
- Settings are administered globally; there is no way to set a particular AP to mitigate.
- Mitigation is performed only on clients associated to rogue APs; the rogue APs themselves are not mitigated. It is the network administrator’s responsibility to remove the rogue APs from the network.
- AP mitigation frames are prioritized below QoS frames, but above Best Effort frames.
- To reduce network traffic, you may configure the scanning channels list that contains only the home channels

© 2012 Meru Networks, Inc.

Changing the Number of Mitigating APs with the CLI

By default, three Mitigating APs are selected by the controller to perform scanning and mitigation. This number can be set to a high of 20 APs or down to 1 AP, depending on the needs of your network. To change the number of mitigating APs to 5:

```
controller (config)# rogue-ap assigned-aps 5
```

Changing the Scanning and Mitigation Settings with the CLI

When rogue AP scanning is enabled, for any given period, the AP spends part of the time scanning channels, and part of the time performing normal AP WLAN operations on the home channel. This cycle of scan/operate repeats so quickly that both tasks are performed without noticeable network operation degradation.

If scanning is enabled, the **rogue-ap operational-time** command sets the number of milliseconds that are spent in operational time, performing normal wireless services, on the home channel. This command is related to the **rogue-ap scanning-time** command. The channels that are scanned are determined by the **rogue-ap scanning channels** command. The complete set of default channels are 1,2,3,4,5,6,7,8,9,10,11,36,40,44,48,52,56,60,64,149,153,157,161,165.

The following command changes the operational time from the default 400 to 2500 milliseconds:

```
controller (config)# rogue-ap operational-time 2500
```

The following command changes the scanning time from the default 100 to 200 milliseconds:

```
controller (config)# rogue-ap scanning-time 200
```

The following command sets the scanning channels to 1, 6, 11, 36, 44, 52, 60:

```
controller (config)# rogue-ap scanning-channels 1,6,11,36,44,52,60
controller (config)# exit
```

To verify the changes, use the **show rogue-ap globals** command:

```
controller# show rogue-ap globals
Global Settings

Detection                            : on
Mitigation                           : selected
Rogue AP Aging (seconds)             : 60
Number of Candidate APs              : 5
Number of Mitigating APs             :5
Scanning time in ms                  : 200
Operational time in ms               : 2500
Max mitigation frames sent per channel : 10
Scanning Channels                    : 1,6,11,36,44,52,60
RSSI Threshold for Mitigation        : -100
```

 © 2012 Meru Networks, Inc.

Changing the Minimum RSSI with the CLI

RSSI is the threshold for which APs attempt to mitigate rogues; if the signal is very week (distant AP), APs won't try to mitigate it.

The command to change the minimum RSSI (Received Signal Strength Indication) level, over which a station will be mitigated is **rogue-ap min-rssi**. A level range of 0 of -100 is supported, with -100 being the default setting.

The following command sets the minimum RSSI level to -80:

```
controller (config)# rogue-ap min-rssi -80
controller (config)#
```

Table 13: CLI Commands for Rogue Mitigation

Rogue Mitigation Command	Action
rogue-ap mitigation all	Sets rogue mitigation for all rogue APs that are not on the access control list.
rogue-ap mitigation selected	Sets rogue mitigation for all rogue APs that are on the blocked list.
rogue-ap mitigation wiredrogue	Sets rogue mitigation for all wired-side rogue APs. If rogue clients on the wired side are added to the blocked ACL list, then only those listed wired-side rogue clients are blocked.
show rogue-ap globals	Displays current rogue data.
rogue-ap mitigation none	Turns off rogue mitigation.

Rogue Mitigation Example

Rogue AP mitigation for APs in the blocked list is enabled and confirmed as follows:

```
controller# configure terminal
controller(config)# rogue-ap detection
controller(config)# rogue-ap mitigation selected
controller(config)# exit
controller# show rogue-ap globals
Global Settings

Detection                              : on
Mitigation                             : selected
Rogue AP Aging (seconds)               : 60
Number of Candidate APs                : 3
Number of Mitigating APs               : 5
Scanning time in ms                    : 100
Operational time in ms                 : 400
```

© 2012 Meru Networks, Inc.

```
Max mitigation frames sent per channel : 10
Scanning Channels                      :
   1,2,3,4,5,6,7,8,9,10,11,36,40,44,48,52,
56,60,64,149,153,157,161,165
RSSI Threshold for Mitigation          : -100
```

Modify Rogue Detection and Mitigation Settings with the CLI

The default settings that are configured for the rogue AP detection and mitigation features are adequate for most situations. However, many default settings can be changed if your network requires lighter or heavier scanning and/or mitigation services. The following is the list of **rogue-ap** commands:

```
controller(config)# rogue-ap ?
acl                   Add a new rogue AP ACL entry.
aging                 Sets the aging of alarms for rogue APs.
assigned-aps          Number of APs assigned for mitigation.
blocked               Add a new rogue AP blocked entry.
detection             Turn on rogue AP detection.
min-rssi              Sets RSSI Threshold for Mitigation.
mitigation            Set the rogue AP mitigation parameters.
mitigation-frames     Sets the maximum number of mitigation frames sent
   out per channel.
operational-time      Sets the APs time on the home channel during
   scanning.
scanning-channels     Sets the global Rogue AP scanning channels.
scanning-time         Sets the APs per channel scanning time
```

As a general rule, unless the AP is in dedicated scanning mode, the more time that is spent scanning and mitigating, the less time is spent by the AP in normal WLAN operating services. Some rules determine how service is provided:

- The controller picks the APs that will scan and mitigate; those that mitigate are dependant on their proximity to the rogue AP and the number of mitigating APs that have been set.
- To preserve operational performance, APs will mitigate only the home channel if they have clients that are associated.
- Settings are administered globally; there is no way to set a particular AP to mitigate.
- Mitigation is performed only on clients associated to rogue APs; the rogue APs themselves are not mitigated. It is the network administrator’s responsibility to remove the rogue APs from the network.
- AP mitigation frames are prioritized below QoS frames, but above Best Effort frames.
- To reduce network traffic, you can configure the scanning channels list that contains only the home channels.

 © 2012 Meru Networks, Inc.

Changing the Number of Mitigating APs with the CLI

By default, three mitigating APs are selected by the controller to perform scanning and mitigation. This number can be set to a high of 20 APs or down to 1 AP, depending on the needs of your network, although we do not recommend assigning a high number of APs for mitigation because they can interfere with each other while mitigating the rogue. To change the number of mitigating APs to 5:

controller(config)# **rogue-ap assigned-aps 5**

Changing the Scanning and Mitigation Settings with the CLI

When rogue AP scanning is enabled, for any given period, the AP spends part of the time scanning channels, and part of the time performing normal AP WLAN operations on the home channel. This cycle of scan/operate repeats so quickly that both tasks are performed without noticeable network operation degradation.

If scanning is enabled, the **rogue-ap operational-time** command sets the number of milliseconds that are spent in operational time, performing normal wireless services, on the home channel. This command is related to the **rogue-ap scanning-time** command. The channels that are scanned are determined by the **rogue-ap scanning channels** command. The complete set of default channels are 1,2,3,4,5,6,7,8,9,10,11,36,40,44,48,52,56,60,64,149,153,157,161,165.

The following command changes the operational time from the default 400 to 2500 milliseconds:

```
controller(config)# rogue-ap operational-time 2500
```

The following command changes the scanning time from the default 100 to 200 milliseconds:

```
controller(config)# rogue-ap scanning-time 200
```

The following command sets the scanning channels to 1, 6, 11, 36, 44, 52, 60:

```
controller(config)# rogue-ap scanning-channels 1,6,11,36,44,52,60
controller(config)# exit
```

To verify the changes, use the **show rogue-ap globals** command:

```
controller# show rogue-ap globals
Global Settings

Detection                              : on
Mitigation                             : selected
Rogue AP Aging (seconds)               : 60
Number of Candidate APs                : 5
Number of Mitigating APs               : 5
Scanning time in ms                    : 200
Operational time in ms                 : 2500
Max mitigation frames sent per channel : 10
Scanning Channels                      : 1,6,11,36,44,52,60
RSSI Threshold for Mitigation          : -100
```

© 2012 Meru Networks, Inc.

Changing the Minimum RSSI with the CLI

RSSI is the threshold for which APs attempt to mitigate rogues; if the signal is very week (distant AP), APs won't try to mitigate it.

The command to change the minimum RSSI (Received Signal Strength Indication) level, over which a station will be mitigated is **rogue-ap min-rssi**. A level range of 0 of -100 is supported, with -100 being the default setting.

The following command sets the minimum RSSI level to -80:

```
controller(config)# rogue-ap min-rssi -80
controller(config)#
```

Configure Rogue AP Mitigation with the Web UI

To prevent clients of unauthorized APs from accessing your network, enable the options for both scanning for the presence of rogue APs and mitigating the client traffic originating from them. These features are set globally, with the controller managing the lists of allowable and blocked WLAN BSSIDs and coordinating the set of APs (the Mitigating APs) that perform mitigation when a rogue AP is detected.

When rogue AP scanning (detection) is enabled, for any given period, the AP spends part of the time scanning channels (determined by the Scanning time in ms setting), and part of the time performing normal AP WLAN operations on the home channel (determined by the Operational time in ms setting). This cycle of scan/operate repeats so quickly that both tasks are performed without noticeable network operation degradation.

The channels that are scanned by a particular AP are determined by the model of AP. As a result of the channel scan, a list of rogue APs is compiled and sent by the controller to a number of Mitigating APs that are closest to the rogue AP. Mitigating APs send mitigation (deauth) frames to the rogue AP where clients are associated to remove those clients from the network. This presence of the rogue AP generates alarms that are noted on the Web UI monitoring dashboard and via syslog alarm messages so the administrator is aware of the situation and can then remove the offending AP or update the configuration list.

As well, if a rogue device seen on the wired interface of the AP and if the device is in the AP's discovered list of stations a wired rogue notification will be sent via the Web UI monitoring dashboard and syslog alarm message. If the rogue client is associated with the AP, that client is also classified as a rogue.

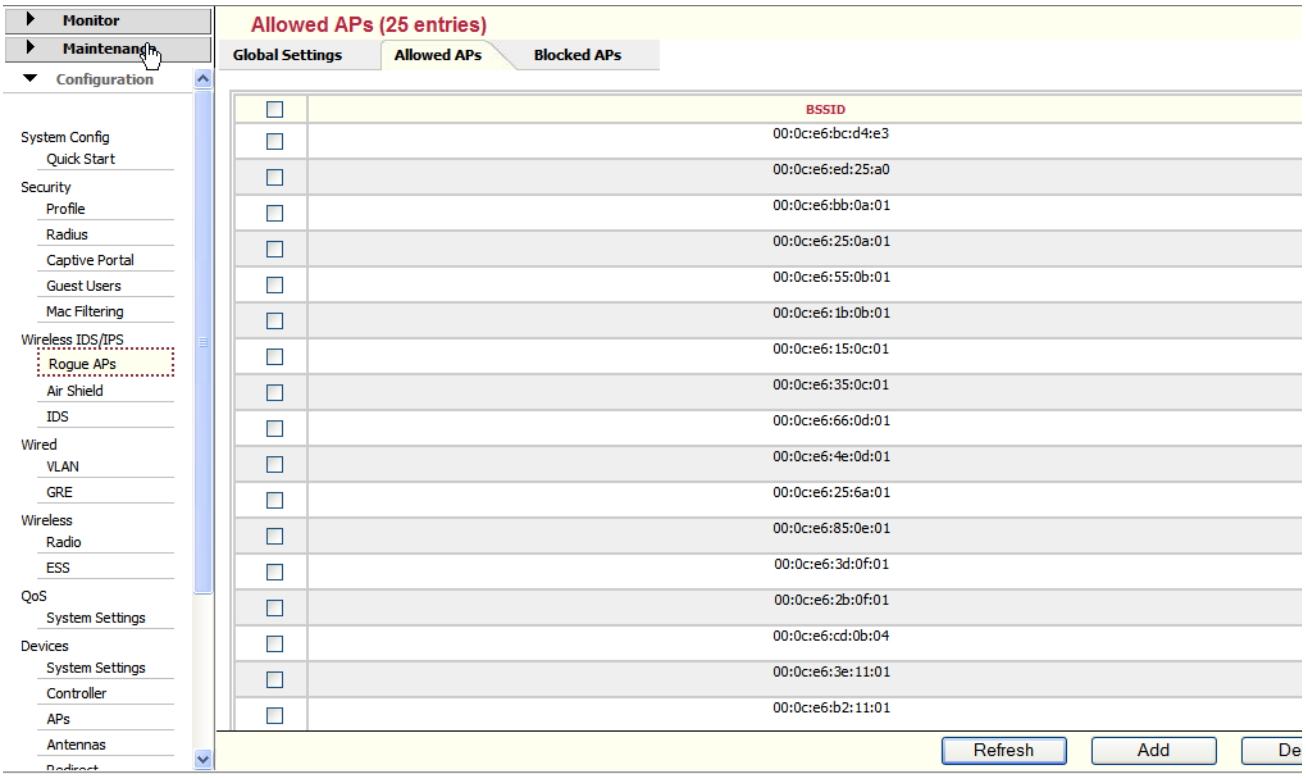
Alter the List of Allowed APs with the Web UI

To change the list of allowed APs, follow these steps:

1. From the Web UI, click **Configuration > Wireless IDS/IPS > Rogue APs > Allowed APs**.
   The Allowed APs screen appears. See **Figure 28**.

 © 2012 Meru Networks, Inc.

Figure 30: Web UI List of Allowed APs



2. To add a BSSID to the list, click **Add**.
   a. In the BSSID boxes, type the BSSID, in hexadecimal format, of the permitted access point.
   b. To add the BSSID to the ACL, click **OK**.
3. To delete a BSSID from the list, select the BSSID, click **Delete**, then **OK.**

Alter the List of Blocked APs with the Web UI

To change the list of allowed APs, follow these steps:

1. From the Web UI click **Configuration > Wireless IDS/IPS > Rogue APs > Blocked APs**. The table shows information about access points listed as blocked BSSIDs in the access control list (ACL).
2. To see an updated list of the APs blocked in the WLAN, click **Refresh**.
3. To add an AP to the blocked list, click **Add.**
   a. In the BSSID box, type the BSSID, in hexadecimal format, of the access point.
   b. Add the BSSID to the ACL, by clicking **OK**.
4. The blocked BSSID now appears on the list with the following information:
   — **BSSID** The access point's BSSID.
   — **Creation Time** The timestamp of when the blocked AP entry was created.

© 2012 Meru Networks, Inc.

— **Last Reported Time** The time the AP was last discovered. If this field is blank, the AP has not been discovered yet.

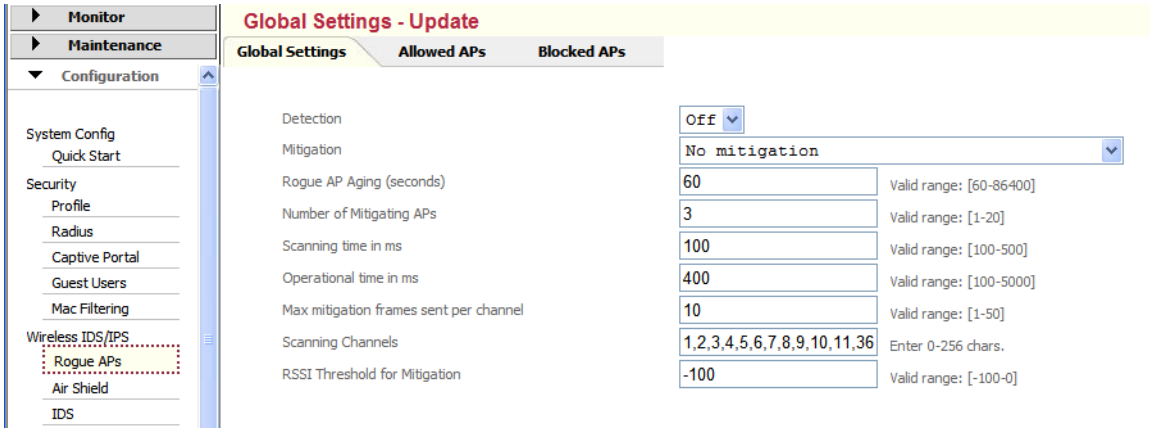
5. To remove a blocked BSSID from the ACL, select the checkbox of the blocked AP entry you want to delete, click **Delete**, and then click **OK**.

Configure Scanning and Mitigation Settings with the Web UI

To configure rogue AP scanning and mitigation settings, follow these steps:

1. From the Web UI click **Configuration > Wireless IDS/IPS > Rogue APs**.
   The Rogue AP screen appears with the Global Settings tab selected. See **Figure 29**.

Figure 31: Web UI Rogue AP Global Settings



2. In the Detection list, select one of the following:
   — **On**: Enables scanning for rogue APs.
   — **Off**: Disables rogue detection.
3. In the Mitigation list, select one of the following:
   — **No mitigation**: No rogue AP mitigation is performed.
   — **Block all BSSIDs that are not in the ACL**: Enables rogue AP mitigation of all detected BSSIDs that are not specified as authorized in the Allowed APs list.
   — **Block only BSSIDs in blocked list**: Enables rogue AP mitigation only for the BSSIDs that are listed in the Blocked APs list.
   — **Block Clients seen on the wire**: Enables rogue mitigation for any rogue station detected on the wired side of the AP (the corporate network, in many cases). When **Block clients seen on the wire** is selected, clients seen on the corporate network are mitigated. When **Block clients seen on the wire** is selected and the BSSID of the wired rogue client is entered in the blocked list (see **Alter the List of Blocked APs with the Web UI**) only listed clients are mitigated.
4. In the Rogue AP Aging box, type the amount of time that passes before the rogue AP alarm is cleared if the controller no longer detects the rogue. The value can be from 60 through 86,400 seconds.
5. In the Number of Mitigating APs text box, enter the number of APs (from 1 to 20) that will perform scanning and mitigation of rogue APs.

 © 2012 Meru Networks, Inc.

6. In the Scanning time in ms text box, enter the amount of time Mitigating APs will scan the scanning channels for rogue APs. This can be from 100 to 500 milliseconds.
7. In the Operational time in ms text box, enter the amount of time Mitigating APs will spend in operational mode on the home channel. This can be from 100 to 5000 milliseconds.
8. In the Max mitigation frames sent per channel text box, enter the maximum number of mitigation frames that will be sent to the detected rogue AP. This can be from 1 to 50 deauth frames.
9. In the Scanning Channels text box, enter the list of channels that will be scanned for rogue APs. Use a comma separated list from 0 to 256 characters. The complete set of default channels are 1,2,3,4,5,6,7,8,9,10,11,36,40,44,48,52,56,60,64,149,153,157,161,165.
10. In the RSSI Threshold for Mitigation text box, enter the minimum threshold level over which stations are mitigated. The range of valid values is from to -100 to 0.
11. Click **OK**.

Note: If a station that is already present in the discovered station database (learned wirelessly by the AP) is also discovered via DHCP broadcast on the APs wired interface, it implies that the station is connected to the same physical wired network as the AP. Such a station could potentially be a rogue device and is flagged by the controller as a wired rogue, indicating the rogue was identified as being present on the same wired network as the AP. If mitigation is enabled for wired rogue, mitigation action is performed accordingly on the rogue device.

Troubleshooting Rogue Mitigation

Check if the rogue AP is being displayed in the discovered list of stations on the AP or the rogue list on the controller.

If the system is taking too long to find a rogue, reduce the number of channels that need to be scanned.

Chapter 12
Configuring VLANs

A virtual local area network (VLAN) is a broadcast domain that can span across wired or wireless LAN segments. Each VLAN is a separate logical network. Several VLANs can coexist within any given network, logically segmenting traffic by organization or function. In this way, all systems used by a given organization can be interconnected independent of physical location. This has the benefit of limiting the broadcast domain and increasing security. VLANs can be configured in software, which enhances their flexibility. VLANs operate at the data link layer (OSI Layer 2), however, they are often configured to map directly to an IP network, or subnet, at the network layer (OSI Layer 3). You can create up to 512 VLANs.

IEEE 802.1Q is the predominant protocol used to tag traffic with VLAN identifiers. VLAN1 is called the default or native VLAN. It cannot be deleted, and all traffic on it is untagged. A trunk port is a network connection that aggregates multiple VLANs or tags, and is typically used between two switches or between a switch and a router. VLAN membership can be port-based, MAC-based, protocol-based, or authentication-based when used in conjunction with the 802.1x protocol. Used in conjunction with multiple ESSIDs, VLANs support multiple wireless networks on a single Access Point using either a one-to-one mapping of ESSID to VLAN, or mapping multiple ESSIDs to one VLAN. By assigning a security profile to a VLAN, the security requirements can be fine-tuned based on the use of the VLAN, providing wire-like security or better on a wireless network.

VLAN assignment is done for Radius-based MAC filtering and authentication. VLAN assignment is not done in Captive Portal Authentication by any of the returned attributes. Because VLANs rely on a remote switch that must be configured to support trunking, also refer to the Meru Wi-Fi Technology Note WF107, “VLAN Configuration and Deployment.” This document contains the recommended configuration for switches as well as a comprehensive description of VLAN configuration and deployment.

Configure and Deploy a VLAN

VLANs can be configured/owned either by E(z)RF Network Manager or by a controller. You can tell where a profile was configured by checking the read-only field Owner; the Owner is either **nms-server** or **controller**.

© 2012 Meru Networks, Inc.

In order to map an ESSID to a VLAN, the VLAN must first be configured. To create a VLAN from the CLI, use the command **vlan** *name* **tag** *id.* The *name* can be up to 16 alphanumeric characters long and the tag *id* between 1 and 4,094.

For example, to create a VLAN named guest with a tag number of 1, enter the following in global configuration mode:

```
controller (config)# vlan guest tag 1
controller (config-vlan)#
```

As shown by the change in the prompt above, you have entered VLAN configuration mode, where you can assign the VLAN interface IP address, default gateway, DHCP Pass-through or optional DHCP server (if specified, this DHCP server overrides the controller DHCP server configuration).

In the following example, the following parameters are set:

- VLAN interface IP address: 10.1.1.2 with a subnet mask of 255.255.255.0
- Default gateway: 10.1.1.1
- DHCP server: 10.1.1.254

```
controller (config-vlan)# ip address 10.1.1.2 255.255.255.0
controller (config-vlan)# ip default-gateway 10.1.1.1
controller (config-vlan)# ip dhcp-server 10.1.1.254
controller (config-vlan)# exit
controller (config)#
```

To create a VLAN from the GUI, click **Config > Wired > VLAN > Add**.

Bridged APs in a VLAN

When creating an ESS, AP300/AP400 and AP1000 can be configured to bridge the traffic to the Ethernet interface. This is called bridged VLAN dataplane mode (per ESSID); it is also sometimes known as Remote AP mode. These two AP models also have the capability to tag the Ethernet frames when egressing the port, using 802.1Q VLAN tags, and setting the 802.1p priority bit. Bridging is configured setting the Dataplane Mode parameter in the ESS profile to **Bridged** (default is **Tunneled**).

In **Tunneled mode,** all traffic in an ESS is sent from the AP to the controller, and then forwarded from there. This is configured on a per ESS profile basis. In **Bridged** mode, client traffic is sent out to the local switch. Meru control and coordination traffic is still sent between the AP and the controller.

Remote AP300/AP400s can use VLANs with System Director 4.0 and later. When configuring an ESS, the Dataplane Mode setting selects the type of AP/Controller configuration:

Bridged VLANs support:

- Non-Virtual Cell

 © 2012 Meru Networks, Inc.

- Virtual Port
- Radius profile for Mac Filtering/1x/WPA/WPA2
- Standard DSCP/802.1q to AC mapping defined in WMM
- Radius profile for Mac Filtering/1x/WPA/WPA2

Bridged VLANs do not support:

- Meru rule-based QoS rules. Instead, bridged VLANs support a standard DSCP/802.1q to AC mapping defined in WMM.
- Display of mobiles' DHCP addresses
- Printing IP address changes or discoveries in a station log
- Captive Portal related Radius profiles
- RADIUS assigned VLANs (even with 802.1x)
- Reactive/proactive diagnostics
- It doesn't display mobile's DHCP addresses, and the station log, IP address change, and IP address discovery is not printed out.

See the ESSID chapters in this guide for more information on configuring an ESSID.

Delete a VLAN

You cannot delete a VLAN if it is currently assigned to an ESSID (see Chapter 5, "Configuring an ESS" on page 49). You cannot delete a VLAN created by E(z)RF Network Server; that must be done from Network Server. To delete a VLAN created on a controller, use the following command in global configuration mode:

no vlan *name*

For example, to delete the VLAN name vlan1, enter the following:

```
controller (config)# no vlan vlan1
controller (config)#
```

More About VLANs

System Director provides commands for configuring both virtual LAN (VLANs) and Generic Routing Encapsulation (GRE) tunnels to facilitate the separation of traffic using logical rather than physical constraints. As an alternative to VLANs, if the optional Generic Routing Encapsulation (GRE) feature is licensed, GRE Tunneling can be configured on the either Ethernet interface, as described in **Configure GRE Tunnels**

© 2012 Meru Networks, Inc.

in the Security chapter. VLANs and GRE tunnels can coexist within any given network, logically segmenting traffic by organization or function. In this way, all systems used by a given organization can be interconnected, independent of physical location. This has the benefit of limiting the broadcast domain and increasing security.

VLANs, when used in conjunction with multiple ESSIDs, as discussed in **Chapter 5, "Configuring an ESS,"** allow you to support multiple wireless networks on a single access point. You can create a one-to-one mapping of ESSID to VLAN or map multiple ESSIDs to one VLAN.

Customized security configuration by VLAN is also supported. By assigning a VLAN a Security Profile, you can fine-tune the security requirements based on the use of the VLAN (see **Chapter 8, "Configuring Security,"** for details).

 © 2012 Meru Networks, Inc.

Chapter 13
Configuring Access Points

This chapter includes instructions for the following:

- How AP Discovery Works
- Add and Configure an AP with the Web UI
- Configure an AP's Radios with the Web UI
- Add and Configure an AP with the CLI
- Configure an AP's Radios with the CLI
- Configuring an AP's Radio Channels
- Supported Modes of Operation for APs
- Configure Gain for External Antennas
- Automatic AP Upgrade
- Viewing AP Status

How AP Discovery Works

There are three types of access point discovery:

- Layer 2 only—Access point is in same subnet as controller.
- Layer 2 preferred—Access point sends broadcasts to find the controller by trying Layer 2 discovery first. If the access point gets no response, it tries Layer 3 discovery.
- Layer 3 preferred—Access point send broadcasts to find the controller by trying Layer 3 discovery first. If the access point gets no response, it tries Layer 2 discovery.

For Layer 2 and Layer 3 discovery, the access point cycles between Layer 2 and Layer 3 until it finds the controller. The access point waits 16 seconds before cycling between Layer 2 and Layer 3.

An access point obtains its own IP address from DHCP (the default method), or you can assign a static IP address. After the access point has an IP address, it must find a controller's IP address. By default, when using Layer 3 discovery, the access point obtains the controller's IP address by using DNS and querying for hostname

© 2012 Meru Networks, Inc.

"wlan-controller." This presumes the DNS server knows the domain name where the controller is located. The domain name can be entered via the AP configuration or it can be obtained from the DHCP server, but without it, an Layer 3-configured AP will fail to find a controller. Alternately, you can configure the AP to point to the controller's IP directly (if the controller has a static IP configuration).

After the access point obtains the controller IP address, it sends broadcast messages using UDP port 9393. After the controller acknowledges the messages, a link is formed between the AP and the controller.

Add and Configure an AP with the Web UI

When you add an AP to a controller, you configure these features:

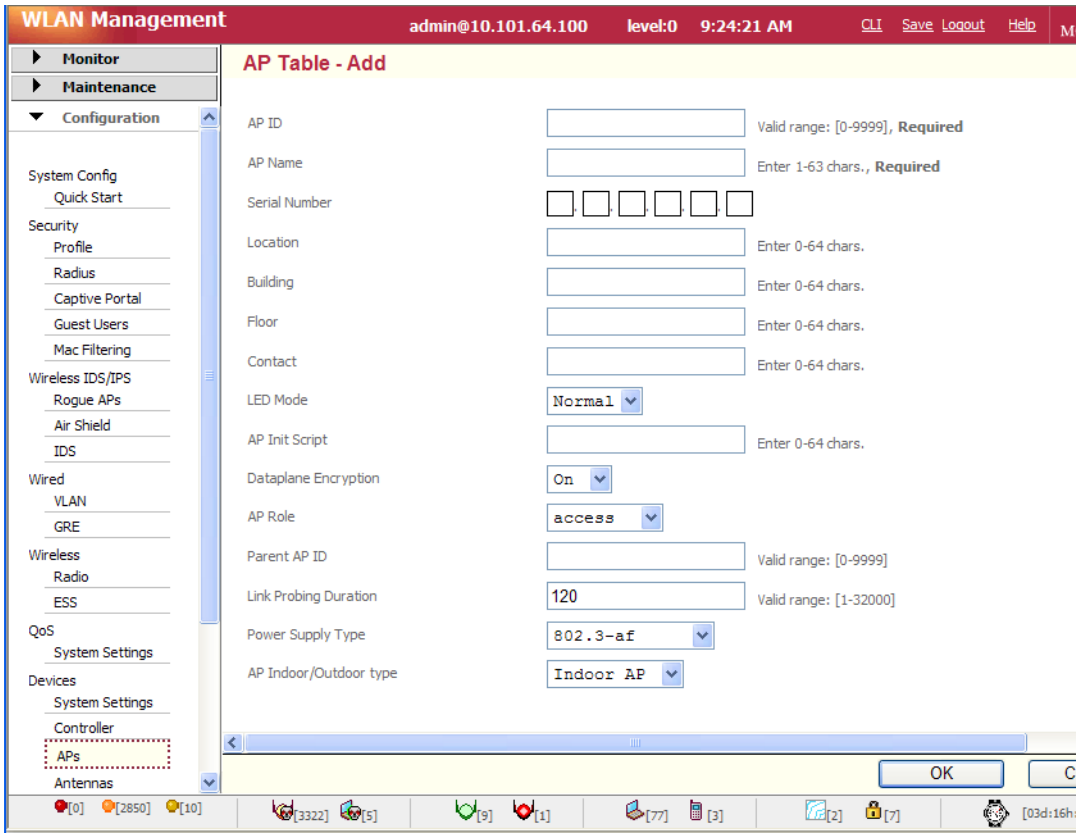
- AP ID
- AP Name
- Serial Number
- Location, Building, Floor
- Contact
- LED Mode
- Boot script (AP Init Script)
- Dataplane Encryption
- AP Role
- Parent AP ID
- Link Probing Duration
- Power Supply Type
- AP Indoor/Outdoor Type

Meru Access Points can be connected to the controller through a Layer 2 network or a Layer 3 network. To both add and configure an AP, follow these steps:

1. Click **Configuration > Devices > APs > Add**.
   The AP Table Add window displays.

 © 2012 Meru Networks, Inc.

Figure 32: Add an AP to the Network



2. Provide the following values and then click **OK**.

Field	Description
AP ID (required)	Unique AP numeric identifier up to 9999 characters long
AP Name (required)	Alphanumeric string up to 64 characters long assigned as identifier for the access point. Note that it can be helpful to name the AP something descriptive, such as a means of indicating its location in the building.
Serial Number (optional)	These boxes are designed to hold the MAC address which is part of the longer part number on the bottom of an AP. The MAC address is the last 12 numbers.
Location (optional)	Alphanumeric string up to 64 characters long
Building (optional)	Alphanumeric string up to 64 characters long

Field	Description
Floor (optional)	Alphanumeric string up to 64 characters long
Contact (optional)	Alphanumeric string up to 64 characters long
LED Mode (optional)	Sets LED appearance on AP300/AP400 and AP1000. **Normal:** LEDs are as described in the *Access Point Installation Guide* **Node ID:** Not supported in release 5.1 **Blink:** Sets all LEDs flashing; this is useful to locate one AP. The blink sequence is unique for different AP models. **Dark:** Turns off all LEDs except power
AP Init Script (optional)	Name of an initialization script that the access point runs when booted. If nothing is configured here, the AP uses the default bootscript.
Dataplane Encryption (optional)	In a Mesh configuration, selects how the AP and Controller pass data packets: **On**: the AP-Controller link is encrypted **Off**: the AP-Controller link is unencrypted (default)
AP Role (optional)	In a Mesh configuration, determines the role that the AP plays in the mesh: **access**: Access point is operating as a standard, wired AP. **wireless**: Access Point is part of the Enterprise Mesh configuration, providing wireless access services to 802.11/bg clients and backhaul services on the 802.11/a link. **gateway**: Access point is part of the Enterprise Mesh configuration, providing the link between the wired and wireless service.
Parent AP ID (optional)	In a Mesh configuration, a wireless AP is directed to look for a signal from a Parent AP, which provides the wireless AP with its backhaul connectivity. Several APs can be assigned the same Parent AP ID.
Link Probing Duration (optional)	Length of time (from 1 to 32000 minutes) that bridged APs wait before rebooting when the controller link is broken. This setting is used in Remote AP configurations to prevent AP reboots when the connectivity to the remote controller is lost. The default is 120.
KeepAlive Timeout (seconds)	In the **KeepAlive Timeout (seconds)**, specify the duration of time (from 1 to 1800 seconds), for the remote APs to remain in the online state with respect to the controller, even when the link to the AP is down. The discovery message from the controller to the AP is modified depending on the time lapse provided in the Link Probing Duration box and the KeepAlive Timeout (seconds) box. The default is 20.

 © 2012 Meru Networks, Inc.

Field	Description
Power Supply Type (AP300 only—not configurable with AP400)	**802.3-af:** Default AP300 power supply. Select this when using a traditional PoE. This power supply type supports 2x2 MIMO mode on both radios; both radios cannot run 3x3 MIMO with this PoE. **802.3-at:** Select when using a higher-powered, next generation PoE. This power supply type supports 3x3 MIMO mode on AP320 and AP400. **5V-DC:** Select when AP300 is plugged into a wall outlet. This power supply type supports 3x3 MIMO mode on AP320. It can also support 2x2 MIMO on AP1000. This option is not available for AP400 models. **dual-802.3:** Not supported in release 5.1.
AP Indoor/ Outdoor AP (optional)	An Indoor and outdoor AP have different regulatory settings for channels and power levels. This setting adjusts those values. AP180 defaults to **outdoor** and the other APs default to **indoor**.

Configure an AP's Radios with the Web UI

After you **Add and Configure an AP with the Web UI**, the AP's radios will be listed in System Director. Follow these steps to configure the radios:

1. Click **Configuration > Wireless > Radio**.
2. Select one of the radios by clicking the red arrow in the first column; remember that most APs have two radios. In that case, you will want to configure both of them.
3. There are three tabs of settings for a radio, **Wireless Interface**, **Wireless Statistics**, and **Antenna Property**. Wireless Interface is the default tab. Here you see the existing interface settings for the radio. Any setting that is greyed out cannot be changed. Make any of the changes listed in the following chart, and then click **OK**.

Field	Description
Interface Description	Description can be up to 256 alphanumeric characters long and contain spaces (for example, Lobby AP interface 1). By default, the description is ieee80211-ap_id-index_ID.
Administrative Status	Indicate whether the interface is to be used: — **Up**: Enable the interface — **Down**: Disable the interface

© 2012 Meru Networks, Inc.

Field	Description
Channel	In the drop-down list, select the channel number for the wireless interface to use. The channel numbers displayed depend on the RF Band Selection and the regulatory domain for each country; for example, in the United States 802.11b shows channels 1 through 11 and 802.11a shows channels 36, 40, 44, etc. Two access points can belong to the same virtual AP only if they are on the same channel. Thus, two neighboring access points on different channels cannot perform seamless handoff (0 ms).
Short Preamble	Short preambles are more efficient on the air, but not all clients support them. — **On** — **Off**
RF Band Selection	Select the RF Band this interface uses. Available selections are based on both the AP model and radio cards installed (for example, 802.11an) and the licensing in effect.
Transmit Power High	Meru AP radios operate at their maximum power level by default. High power level increases the signal strength of the frames received by the client stations, allowing a client station to decode frames at a higher rate and increasing the coverage area. This causes minimal interference because Meru uses Virtual Cell technology, moving clients to a better AP without re-association. For a very few cases, we recommend that you reduce the power level on APs due to co-channel-interference. Check with Support first to make sure your issue really is due to co-channel-interference. To change transmit power, change the value in the Transmit Power High (dBm) field. The maximum level depends on the country code and the RF band in use.
AP Mode	Select whether the radio for the interface is in **Normal Mode** (servicing clients first and scanning in the background) or **Scanning Mode** (dedicated monitoring for Rogue APs).
Protection Mode	Configures 802.11b/g interoperability mode. This setting defaults to **auto** and should not be changed without consulting Meru Support.
Channel Width	Channel Width can be: — **20 MHz** — **40MHz Extension Channel Above** — **40MHz Extension Channel Below** Note that all APs in a Virtual Cell must have the same channel width.
MIMO Mode	Select: **2x2** for either AP1000 or AP300 with an 802.3af PoE **3x3** for AP300 or AP400 depending on radio and power source configuration

© 2012 Meru Networks, Inc.

Field	Description
802.11n Only Mode	802.11n only mode is for AP300/AP400/AP1000s with N capability. Select: **On**: to support only 802.11n **Off**: (default) to support 802.11an or 802.1bgn
Virtual Cell	Virtual Cell Mode enables Virtual Cell for AP300/AP400 only. **On**: enable per-station Virtual Cell on AP300/AP400 **Off**: (default) disable per-station Virtual Cell on AP300/AP400

Note: AP1000 radios always have Virtual Cell enabled, but there is a way to use AP1000 in non-Virtual Cell mode. See **Adding an ESS with the CLI**.

Add and Configure an AP with the CLI

To configure an AP with the CLI, first enter AP configuration mode (first command shown below) and then use the rest of the AP configuration commands:

Command	Purpose
configure terminal	Enter global configuration mode.
ap *ap-id*	Enter AP configuration for the specified AP. Use the command **show ap** to get a list of APs.
... *commands* ...	Enter the AP configuration commands listed in the next chart here.
boot-script *string*	Name of an initialization script that the access point runs when booted. If nothing is configured here, the AP uses the default bootscript.
building *string*	Command to describe building identification.
contact *string*	Enters AP contact information

© 2012 Meru Networks, Inc.

Command	Purpose
connectivity l2-only | l2-preferred | l3-preferred	For AP300/AP400, AP100, and AP150, this setting configures Layer 2 or Layer 3 connectivity to the controller. Using either L3 or L2 preferred also invokes AP connectivity mode where additional connectivity configuration can be done.
dataplane-encryption {**on** | **off**}	In a Mesh configuration, selects how the AP and Controller pass data packets: **On**: the AP-Controller link is encrypted **Off**: the AP-Controller link is unencrypted (default)
description *string*	Enters AP description. Note that this corresponds to the AP Name in the GUI.
floor *string*	Enters AP floor location
led {normal | blink | NodeId | Normal}	Sets LED appearance on AP300/AP400 and AP1000. **Normal:** AP300/AP400 and AP1000 LEDs appear as described in the *Meru Access Point Installation Guide* **Blink:** Sets all LEDs flashing; this is useful to locate an AP **Dark:** Turns off all LEDs
link-probing duration *minutes*	For Remote AP, set the number of minutes between keep-alive signals. Minutes can be between 1 and 3200.
location *string*	Enters AP location information
mac-address *ff:ff:ff:ff:ff:ff*	Sets the MAC address if you are pre-configuring an AP
model *string*	Command to enter the model type of the AP if you are pre-configuring the AP
no boot-script	Disables the boot script
end	Return to privileged EXEC mode.

Configure a Layer 3 AP with the CLI

The following commands can be used to set up a Layer 3 configuration for an AP not in the same subnet as the controller. It specifies the AP will obtain its IP address from DHCP, which allows it to use a DNS server for obtaining its IP address. If the network administrator has added to the DNS server the IP address for the controller hostname "wlan-controller," DNS can return the IP address of the controller with the hostname "wlan-controller:"

```
default# configure terminal
default(config)# ap 1
default(config-ap)# connectivity l3-preferred
default(config-ap-connectivity)# ip address dhcp
default(config-ap-connectivity)# controller hostname wlan-controller
default(config-ap-connectivity)# end
default#
```

The following table presents the commands available within the **ap-connectivity** mode.

Table 14: Summary of Connectivity Mode Commands

Command	Purpose
controller {**domainname** *name*|**hostname** *name*|**ip** *ip-address*}	Configure the controller IP information. • The domainname *name* must be from 1 to 63 characters. • The hostname *name* must be from 1 to 63 characters. • The IP address must be in the format *nnn.nnn.nnn.nnn* or **dhcp** to obtain the AP IP address dynamically.
hostname *name*	Sets the AP hostname. *name* must be from 1 to 63 characters.
ip address {*ip-address*|**dhcp**}	Configures the IP addressing for the AP. • Use *ip-address* to assign a static IP address to the AP. • Use **dhcp** to obtain the AP IP address dynamically.
ip default-gateway *gateway*	Adds an IP address of the default gateway in the format *nnn.nnn.nnn.nnn*
ip dns-server {**primary** *ip-address*|**secondary** *ip-address*}	Adds a DNS server entry for static IP. • **primary** *ip-address* sets a primary DNS server for static IP. • **secondary** *ip-address* sets the secondary DNS server for the static IP.

Configure AP Power Supply, Channel Width, and MIMO Mode with CLI

Set the power supply type, channel width, and MIMO mode by following these steps:

1. Open a terminal session on the controller.
2. Enter configuration mode by with the command **terminal configuration** at the CLI prompt.
3. Select the AP with the command *ap #*, for example, AP1:

   ```
   default(config)# ap 1
   ```

4. Set the power supply value to **5V-DC** for AP Power, **802.3af** Power Over Ethernet, **802.3-at** Power Over Ethernet, or **dual-802.3-af** Power Over Ethernet with the CLI command **power-supply**.

   ```
   default(config-ap)# power-supply 5V-DC
   ```

5. Exit ap configuration mode.

   ```
   default(config-ap) # exit
   ```

6. Enter radio configuration submode with the command **interface Dot11Radio** *node-id interface_ID*. For example, for AP1, interface 1:

   ```
   default(config)# interface Dot11Radio 1 1
   ```

7. Change channel width from 20 MHz (default) to 40 MHz (either 40-mhz-extension-channel-above or 0-mhz-extension-channel-below 40) with the command **channel-width**. This command also sets channel bonding.

   ```
   default(config-if-802)# channel-width above 40 MHz Extension channel
   ```

8. Change MIMO Mode from 2x2 (default) to 3x3 with the **mimo-mode 3x3** command and exit.

   ```
   default(config-if-802)# mimo-mode 3x3
   default(config-if-802)# end
   ```

The AP is now configured.

 © 2012 Meru Networks, Inc.

Configure an AP's Radios with the CLI

Before you can configure any radio settings, you need to enter radio interface configuration mode. To do this, follow these steps:

Table 15: Entering Radio Interface Configuration Mode

Command	Purpose
configure terminal	Enter global configuration mode.
interface Dot11Radio *<ap-id> <Interface ID>*	Enter interface configuration for the specified AP and radio interface. Use **show interfaces Dot11Radio** to obtain a list of radio interfaces.
... commands ...	Enter the 802.11configuration commands here.
end	Return to privileged EXEC mode.
copy running-config startup-config	This is an optional step to save your entries in the configuration file.

Summary of Radio Interface Configuration Commands

The following is a summary of the commands available in radio interface configuration mode:

Table 16: Commands available in Radio Interface Configuration Mode

Command	Purpose
admin-mode	Enables or disables a radio interface.
antenna-property	Manages external wireless interface antennas.
channel	Configures the channel ID.
localpower (new in 3.5)	Configures the AP transmit power level for all APs
mode	AP mode configuration.

© 2012 Meru Networks, Inc.

Table 16: Commands available in Radio Interface Configuration Mode

Command	Purpose
n-only-mode (new in 3.6)	Supports only 802.11n clients on the radio to improve performance.
~~**power**~~	**Note:** Obsolete. Use **localpower** command instead
preamble-short	Enables or disables short preambles.
protection-mode	Configures 802.11b/g interoperability mode. This setting defaults to **auto** and should not be changed without consulting Meru Support.
rf-mode	Configures the Radio Frequency mode (802.11a, b, g, or bg, bgn, or an). Note that All APs on the same channel in a Virtual Cell must have the same setting for rf-mode.
scanning channels	Configures the channels for scanning
tuning	Tunes the wireless interface

Set Radio Transmit Power with the CLI

The radio transmit power changes the AP's coverage area; this setting helps manage contention between neighboring access points. Transmit power for Meru APs is defined as the EIRP1 (Effective Isotropic Radiated Power) at the antenna and includes the antenna gain. (This is important to remember; transmit power is not the power at the connector.) Power level settings are dependent on the country code and the radio band (and for 802.11a, the channel) in use.

For example, if the transmit power, configured with the command **localpower**, is set to 20 dBm2, and the antenna gain is set 3 to 2 dBm, then the actual transmitted power at the connector is 18 dBm.

If an external antenna with an 8dBi (isotropic) gain is used, then adjust the gain value to the same value, 8. If the desired EIRP after the antenna is the same, then keep the transmit power set to the same value, 20. For higher or lower EIRP values, adjust the transmit power to the desired value.

The maximum power setting is an integer between 4-30dBm for 802.11/bg radios.

The Maximum Transmit Power for the 802.11a band is based on the channel in use, as detailed in the following table, which shows the levels for the United States:

 © 2012 Meru Networks, Inc.

802.11a Channel	Maximum Transmit Power (dBm) for United States
36	17
40	23
44	23
48	23
52	30
56	30
60	30
64	30
100	30
104	30
108	30
112	30
116	30
120	30
124	30
128	30
132	30
136	30
140	30
149	36
153	36
157	36
161	36
165	36

© 2012 Meru Networks, Inc.

Use the **localpower** command in the Dot11Radio interface configuration mode to configure the maximum power level.

localpower *max-level*

For example, to set the 802.11a radio maximum power to 15, type

localpower 15

Enable and Disable Short Preambles with the CLI

The radio preamble, also called the header, is a section of data at the head of a packet that contains information that the access point and client devices need when sending and receiving packets. By default, a short preamble is configured, but you can set the radio preamble to long or short:

- A short preamble improves throughput performance.
- A long preamble ensures compatibility between the access point and some older wireless LAN cards. If you do not have any older wireless LAN cards, you should use short preambles.

To disable short preambles and use long preambles, type:

no preamble-short

To enable short preambles, type:

preamble-short

Set a Radio to Scan for Rogue APs with the CLI

To configure radios to constantly scan for rogue APs, use this command from the Dot11Radio interface configuration mode:

mode scanning

To set the radio back to servicing clients, use the command:

mode normal

Enable or Disable a Radio Interface with the CLI

To temporarily disable a radio interface, use this command from Dot11Radio interface configuration mode:

admin-mode Down

To later enable the off-line interface, use the command:

admin-mode Up

 © 2012 Meru Networks, Inc.

Set a Radio to Support 802.11n Only with the CLI

To set an AP320 radio interface to support only 802.11n clients, and thus improve throughput, from the Dot11Radio interface configuration mode use the command:

```
n-only-mode
```

To disable the 802.11n-only support, use the command:

```
no n-only-mode
```

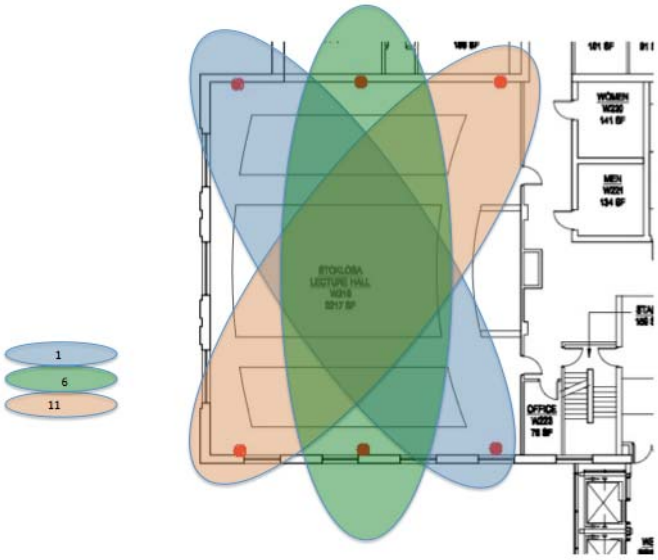
Note that All APs on the same channel in a Virtual Cell must have the same setting for n-only mode.

Configuring an AP's Radio Channels

AP channel configuration is configurable for 802.11bg which consists of 11 overlapping channels in United States deployments. Channel configuration for 802.11a is not an issue because there are no overlapping channels within the 802.11a spectrum.

In the 802.11b/g standard, there are 14 channels. As a result of FCC rules, there are 11 channels: channels 1 through 11 are used in the USA. Other countries may also use channels 12, 13, and 14. These channels represent the center frequency of the wireless transmission wave. In practice, 802.11bg has only three operational frequencies in a given area, and most deployments use channels 1, 6, and 11, for which there is no overlap.

Figure 33: Channel 1, 6, and 11



To assign a channel, use the Dot11Radio interface command **channel**. With the Web UI, configure a channel by clicking **Configuration > Wireless > Radio,** select a radio and then select a **Channel** from the drop-down list.

Replacing APs

Note: Replacing one AP model with another usually preserves the settings of the original configuration. A newer AP may have settings that the older one does not; those settings will be set to the default.

Caution! Despite the fact that some AP settings and configurations can be carried over when replacing an AP, users cannot simply replace an AP300/AP400 with a different model (such as an AP1000). The two models have very different capabilities and configuration specifications and should not be considered synonymous.

If you are replacing existing APs with a newer model of APs, use the **swap ap** command to ease the task of updating your site's AP settings. To use the **swap ap** command, you need the MAC addresses of the new and old APs. There are two ways to determine a MAC address. You can check MAC addresses of the APs to be replaced with the **show ap** command. You can also look on the back of any AP for the MAC address. The serial number is displayed on the label, below the bar code. The last 12 digits of the serial number is the AP MAC address.

The **swap ap** command equates the MAC address of an AP that you want to replace with the MAC address of the new AP. By linking the numbers to an AP ID in the replacement table, the system can assign the configured settings from the old AP to the new AP. The settings that are tracked are the channel number, preamble, and power settings. After inputting the swap information, use the **show ap-swap** command to double check the AP MAC settings before physically swapping the APs.

Once you have double-checked the MAC addresses, take the old APs offline by disconnecting them from the system. Replace the APs. When the APs are discovered, the replacement table is checked, and the changes are applied to the new APs. Once the new AP has been updated, the entry is removed from the replacement table.

To summarize the steps to replace the APs:

```
meru-wifi (config)# do show ap (gets the serial numbers of the APs you are replacing)
meru-wifi (config)# swap ap 00:oc:e6:00:00:66 00:CE:60:00:17:BD
meru-wifi (config)# exit

meru-wifi# show ap-swap
 AP Serial Number         New AP Serial Number
00:0c:e6:00:00:66       00:ce:60:00:17:bd
AP Replacement Table(1 entry)

meru-wifi# show ap (Disconnect the old APs and make sure they show Disconnect/offline
   status)
```

 © 2012 Meru Networks, Inc.

(Replace the old APs with the new APs)

Supported Modes of Operation for APs

AP300/AP400 and AP1000 with two radios can have both set to 5.0 GHz, but both radios cannot be set to 2.4 GHz. If you want to use both radios on 2.4 GHz, put the radios on separate channels.

AP300 and AP1000 radios default to the following bands:

AP Model	Radio 1	Radio 2	Radio 3
AP302	BG	A	-
AP310	BGN		-
AP311	BGN	A	-
AP320	BGN	AN	-
AP1010	BGN		-
AP1020	BGN	AN	-
AP400	BGN	AN	Scanning on both bands

Security Modes

Although AP300/AP400/AP1000 support all security modes supported by the 802.11i security standard (WEP, WPA, WPA2 and mixed mode), 802.11n supports only clear and WPA2 security. Even though you can configure any security mode for 802.11n, you only gain 11n benefits using WPA2 or clear. Because of this, any 11n client connected to an SSID configured for WEP or WPA will behave like a legacy ABG client. An 802.11n ESSID configured for either WEP or WPA has no 802.11n rates for that ESSID. If you configure an ESSID for Mixed Mode, 802.11n rates are enabled only for the WPA2 clients; WPA clients behave like a legacy ABG client. See the chart below for details.

© 2012 Meru Networks, Inc.

ESSID Security	AP300/AP400/AP1000 Realize These 11n Benefits
Clear and WPA2	All 11n benefits are realized.
WEP and WPA	No 11n benefits are realized. Clients behave like legacy ABG clients.
Mixed Mode	11n performance in ESS configured for mixed mode depends on kind of application used in the network. Only WPA2 clients connected to mixed mode have 11n benefits. WPA clients behave like legacy ABG clients.

When APs are in a Virtual Cell

All APs on the same channel in a Virtual Cell must have the same setting for these values:

- RF-Mode
- Channel Width
- N-only Mode

Configure Gain for External Antennas

The total power that an AP produces must not exceed 30dbi; this number includes any antenna gain. Therefore, if an antenna produces 2dbi, the radio can produce 28dbi. System Director automatically sets antenna gain; in the case of an AP300/AP400, it assumes an antenna with 5dbi and therefore sets the AP300/AP400 to 25dbi. This may or may not be correct for your antenna.

To check and change antenna gain, follow these steps from System Director:

1. Click **Configuration > APs** (under Devices).
2. Select an AP ID.
3. Click the **Antenna Property** tab.
4. Select an Interface (**1**/**2**).
5. Change the gain if needed.
6. Click **OK**.

 © 2012 Meru Networks, Inc.

Note: The antenna gain value can never exceed the local power of the radios as set in the Dot 11 physical configuration.

Automatic AP Upgrade

The automatic AP upgrade features is enabled by default. It allows an AP's firmware to be automatically upgraded by the controller when the AP joins the WLAN. An AP cannot provide service (and consequently be part of the WLAN) if its firmware is at a different level than that of the controller.

When an AP initiates its discovery phase, the controller checks the firmware version and initiates an upgrade if the version is not at the same level as that of the controller. This feature simplifies the process of adding and maintaining a group of APs on an existing WLAN.

When the automatic AP upgrade feature is enabled, you can check the upgrade status of affected APs through syslog messages and SNMP traps that warn of an AP/controller software version mismatch. An alarm is dispatched to an SNMP manager if a mismatch exists. After the firmware is downloaded to the AP, the AP boots, attempts discovery, is checked, and after upgrading, runs the new software version. Once the match is confirmed, another set of syslog messages and SNMP traps are sent notifying that the AP/controller software versions match. Alarms are then cleared.

To disable this feature:

```
default# auto-ap-upgrade disable
default# show controller

Viewing AP Status

From the Web UI, view AP radio status by clicking **Monitor > Dashboard > Radio** or **Monitor > Diagnostics > Radio**. Click **Help** for descriptions of the charts. The icons at the bottom of all screens include a green AP (enabled) and a red AP (disabled); you can also see the same information at **Monitor > Dashboard > System**.

There are several CLI commands you can use to view AP status:

Table 17: Commands to View System Status

Command	Purpose
show ap [*index*]	Displays the status of the AP, such as serial number, uptime, operational status, availability, alarm state, security mode, privacy bit, boot script, AP model, and FPGA version. If the AP index is not specified, a summary of the AP status is displayed.
show antenna-property	Displays the antenna properties.
show ap-connectivity	Displays the access point connections.
show ap-discovered	Displays the list of discovered access points and stations.
show ap-limit	Displays how many APs are licensed for this controller.

 © 2012 Meru Networks, Inc.

Table 17: Commands to View System Status

Command	Purpose
show ap-siblings	Displays the AP Siblings table. APs operating in the same channel that can hear each other are AP-siblings. APs can hear beacons with RSSI as low as -80 to -85dbm, but RSSI values lower than this are not heard.
show ap-swap	Displays the access point replacement table.
show ess-ap	Displays the ESS-AP table for the access point.
show interfaces Dot11radio	Displays the configuration of the wireless interface.
show interfaces Dot11Radio statistics	Displays the statistics related to the wireless interface.
show regulatory-domain	Displays the regulatory information for the country.
show statistics top10-ap-problem	Displays a list of the top 10 problem access points.
show statistics top10-ap-talker	Displays a list of the top 10 most active access points.
show topoap	Displays the topology of all access points as seen by the coordinator.
show topoapap	Displays the Received Signal Strength Indicator (RSSI) between all pairs of APs.

Chapter 14
Intercontroller Roaming

When a wireless client can maintain connection from one AP to another, this is roaming. When a client can roam between APs on different controllers on different IP subnets without losing its IP address, roaming becomes inter-controller roaming.

Meru Networks' Intercontroller Roaming feature (ICR) provides IP-IP tunnel-based routing between a group of controllers (a roaming domain) to support IP address mobility for stations. The feature works only if member controllers in a roaming group spans at least two distinct IP subnets. This feature is hence targeted for deployments with a routed network between controllers.

With ICR, a static or DHCP-provisioned IP address of a station remains routable into an Anchor (home) controller while the station roams between other (serving) controllers in the roaming group.

With this feature, the upstream traffic for a client is tunneled to the Anchor Controller, and the downstream traffic is handled by the Guest Controller.

Intercontroller Roaming supports controllers configured in a group of up to 30 Meru controllers (a roaming domain) that is configured with CLI commands to support ICR. At least one controller must be in an IP subnet distinct from the rest; this feature does not work when all controllers of a roaming domain are on the same link.

Controllers must have the same SSID and identical security profiles for those SSIDs spanning the roaming domain. (There can be additional SSIDs local to individual controllers.) ICR can be established between two or more controllers so that the feature activates as long as they have at least one shared ESSID where the subnet bound to the ESSID differs between at least the two controllers.

How Inter-Controller Roaming Works

Intercontroller roaming retains stations' IP addresses by forwarding packets via a dedicated point-to-point tunnel between controllers, using UDP port 9394. Then, a user can roam between supported Meru controllers in the same domain without disconnection or a change of IP address. Any mix of up to 30 supported controller models is supported by ICR. Captive Portal context transfer and multicasting are not supported by ICR.

© 2012 Meru Networks, Inc.

After 802.11 re-authentication takes place on a subsequent AP and controller, the station's original IP address and connectivity are preserved. (Note that the QoS flows are not handed off across the roaming domain.)

Note that intercontroller roaming does not support the dynamic addition or deletion of peers or anchored ESSIDs to/from the roaming domain. Before adding/deleting any peers to/from the existing list, stop the roaming-domain using the command **stop**. And after adding the peers start the roaming domain again using the command **start**.

GRE is not supported in a roaming domain. Captive Portal reauthenticates when it roams to a new ICR controller.

Configuring Intercontroller Roaming with the Web UI

Intercontroller roaming is one of the Global Controller Parameters that you set when you configure a controller at **Configuration > Devices > Controller**. The value for Roaming Domain Sate can be either **Enable** or **Disable**.

Configuring Intercontroller Roaming with the CLI

ICR can only be configured with the CLI. There is no Web UI interface at this time. The following commands are used to configure ICR:

- roaming-domain essid
- roaming-domain peer-controller
- roaming-domain start
- show roaming-domain
- roaming-domain stop
- show roaming-domain

These commands are described in detail in the *System Director Command Reference Guide*.

Intercontroller Roaming Configuration Example

This example lists the three roaming domain commands. The controller 172.19.2.20 is added to the ICR, and then roaming is started.

```
default# configure terminal
default (config)# roaming-domain ?
peer-controller        Add the peer controller into roaming domain.
start                  start roaming domain.
stop                   stop roaming domain.
default (config)# peer-controller 172.19.2.20
default (config)# roaming-domain start
default (config)# exit
default#
```

 © 2012 Meru Networks, Inc.

ICR Limitations

- Each controller is identified by one IP address and this must be the virtual IP address in the Meru interface. No controller IP interface address that participates in a roaming domain can reside in VLAN interface. This address is used as the end-point of inter-controller tunnels. Stations can use VLAN-connected ESSIDs.
- Each controller maintains a list of roaming group members as IP addresses. All member controller configurations **must** have the same list of IP addresses and they **must** be in the same order.
- If a member is added after the group has been created, all controllers **must** add the member and restart the service. The restart will cause stations to be dropped in all member controllers until the feature is back online.

Caution! The above operation is service-disrupting, and should only be performed when absolutely necessary.

- Each member controller should have the exact same shared ESSID configuration to ensure predictable/desired roaming.
- To activate fixed mode, one of the controllers needs to be acknowledged as the DHCP home (a question asked after entering each peer IP address).
- A roaming group can contain up to five controllers.
- Clients using inter-controller roaming can be identified using the command **show roaming-domain all** (my interface addresses, peer controllers, my roaming stations, stations at home here, stations onlink now).
- Tunnels are per-controller.
- For N+1, failover is not seamless but IP layer mobility is retained.
- Ongoing IP sessions such as TCP/IP or UDP/IP continue across inter-controller roaming. Ongoing voice calls also continue but the QoS is not preserved on the subsequent controller; Captive Portal users have to re-authenticate as well.
- Only one roaming domain is supported and the assumption is that all members support the same ESSID among the controllers. An ESSID can be bound to untagged (Meru Networks) or tagged (VLAN) interface.
- No fast roaming is supported, with the switchover time in the order of seconds.
- For this release, dual Ethernet operation, active-active or active-redundant, is not supported.
- After changing VLAN configuration, inter-controller roaming must be restarted.

Chapter 15
Configuring Quality of Service

Quality of Service rules evaluate and prioritize network traffic types. For example, you can prioritize phone calls (VoIP) or prioritize a certain department in a company. This chapter describes QoS settings for Meru Wireless LAN System.

- Configuring QoS Rules With the Web UI
- Configuring QoS Rules With the CLI
- Optimizing Voice Over IP
- Global QoS Settings
- Rate Limiting QoS Rules
- Configuring Codec Rules
- QoS Statistics Display Commands
- More QoS Rule Examples

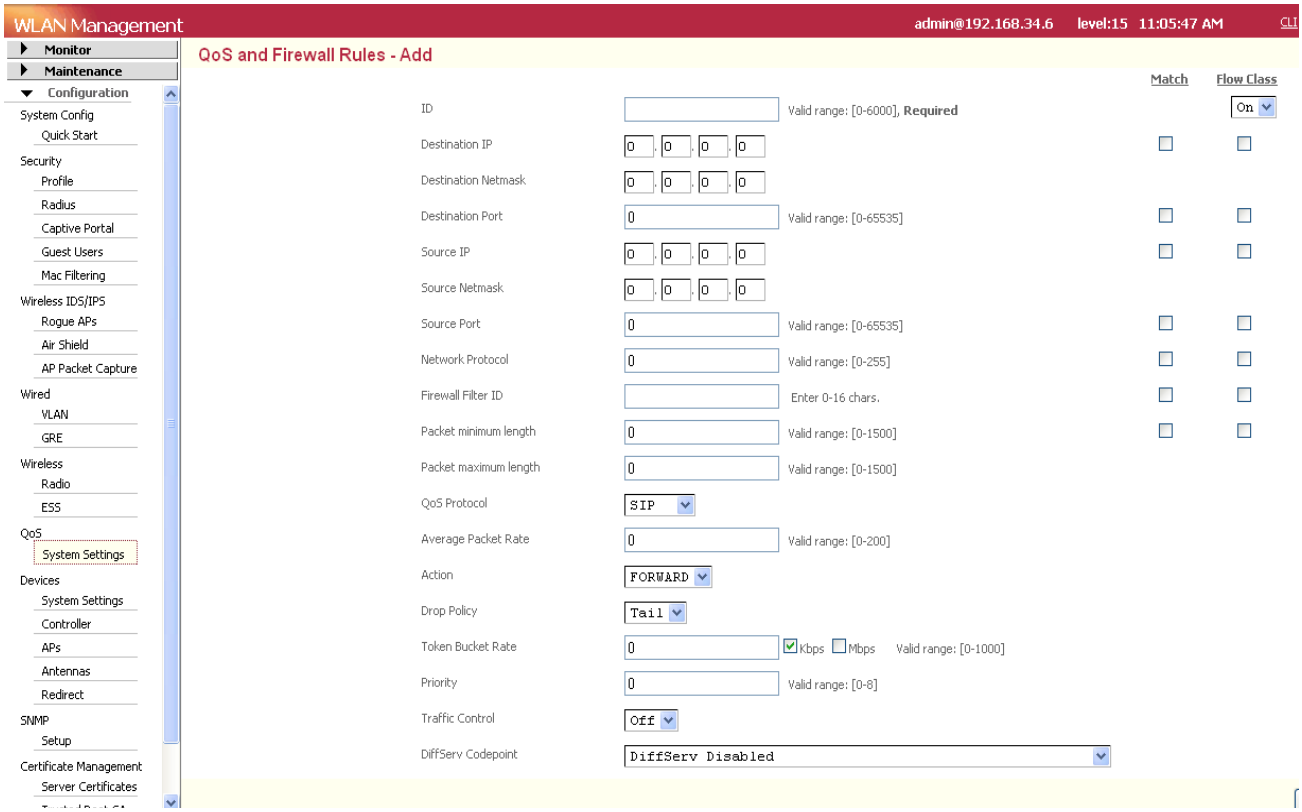
Configuring QoS Rules With the Web UI

To configure QoS rules from the GUI, follow these steps:

1. Click **Configuration > QoS > System Settings > QoS and Firewall Rules** (tab).
2. Click **Add**. The screen below appears.

© 2012 Meru Networks, Inc.

Figure 34: Add a QoS Rule



3. In the ID field, type a unique numeric identifier for the QoS rule. The valid range is from 0 to 6000.
4. In the Destination IP fields, type the destination IP address to be used as criteria for matching the QoS rule. The destination IP address is used with the destination subnet mask to determine matching.
5. In the Destination Netmask fields, type the subnet mask for the destination IP address.
6. In the Destination Port field, type the TCP or UDP port to be used as criteria for matching the QoS rule. To specify any port, type 0 (zero).
7. In the Source IP fields, type the source IP address to be used as the criteria for matching the QoS rule. The source IP address is used with the source subnet mask to determine matching.
8. In the Source Netmask fields, type the subnet mask for the source IP address.
9. In the Source Port field, type the TCP or UDP port to be used as criteria for matching the QoS rule. To specify any port, type 0 (zero).
10. In the Network Protocol field, type the protocol number of the flow protocol for the QoS rule. The protocol number can be a number 0 through 255. The protocol number of TCP is 6, and the protocol number for UDP is 17. For a list of protocol numbers, see http://www.iana.org/assignments/protocol-numbers.

 © 2012 Meru Networks, Inc.

If you are also using a QoS protocol detector, you must match the network protocol with the type of QoS protocol. Use the following network protocol and QoS protocol matches:

- UDP: SIP
- TCP: H.323v1 or SIP

11. In the Firewall Filter ID field, enter the filter-ID to be used (per-user or per-ESS), if Policy Enforcement Module configuration is enabled (optional feature). This ID must be between 1 and 16 alphanumeric characters.
12. In the Packet minimum length field, specify the size of the minimum packet length needed to match the rule. (Valid range: 0-1500.)
13. In the Packet maximum length field, specify the size of the maximum packet length needed to match the rule. (Valid range: 0-1500.)
14. In the QoS Protocol list, select one of the following:
    - SIP
    - H.323v1
    - Other
    - None

    For capture rules, the QoS protocol determines which QoS protocol detector automatically derives the resources needed for the flow (implicitly). Select Other if you want to specify the resource requirements for matched flows explicitly. The QoS protocol value is ignored for non-capture rules.
15. In the Average Packet rate box, type the average flow packet rate. The rate can be from 0 through 200 packets/second.
16. In the Action list, select the action the rule specifies:
    - Forward: A flow is given an explicit resource request, bypassing the QoS protocol detector and regardless of whether a QoS protocol was specified.
    - Capture: The system, using a QoS protocol detector, analyzes the flow for its resource requirements.
    - Drop: The flow is dropped.
17. In the Drop Policy list, select one of the following:
    - Head: New packets that arrive after the queue has reached its maximum length are allowed in the queue, and old information in the queue is replaced with the new information.
    - Tail: New packets that arrive after the queue has reached its maximum length are dropped.
18. In the Token Bucket Rate box, type the rate (in Kbps or Mbps, depending on the option checked) at which tokens are placed into an imaginary token bucket. Each flow has its own bucket, to which tokens are added at a fixed rate. To send a packet, the system must remove the number of tokens equal to the size of the packet from the bucket. If there are not enough tokens, the system waits until enough tokens are in the bucket.

© 2012 Meru Networks, Inc.

19. In the Priority box, type the priority at which the flow is placed in a best-effort queue. Packets in a higher priority best-effort queue are transmitted by access points before packets in lower-priority queues, but after packets for reserved flows.

    Priority can be a value from 0 through 8, with 0 specifying no priority and 8 specifying the highest priority. The default value is 0. If you enable priority (specify a non-zero value), you cannot specify an average packet rate or token bucket rate.

20. In the Traffic Control list, select one of the following:
    - On
    - Off

    For all types of flows (explicit, detected, and best-effort), selecting On for traffic control restricts the flow to the rate you specified. Packets above that rate are dropped.

21. In the DiffServ Codepoint list, select the appropriate DiffServ setting, if applicable.

22. In the QoS Rule Logging list, select whether to enable or disable logging activity for this QoS rule:
    - On
    - Off

23. In the QoS Rule Logging Frequency field, change the default collection interval in which packets related to this rule are logged, if QoS Logging is enabled. The interval must be a number between 30 and 60 (seconds).

24. **Match Checkbox:** For any field with the corresponding **Match** checkbox selected, packets must match the information in the field or they are dropped. If no match box is checked, the opposite happens and all criteria are matched. Also see **More About the Match Checkbox and Flow Class Checkbox**.

25. **Flow Class Checkbox:** Flow Class options are relevant only for Flow Control rules (rules with Traffic Control enabled and Token Bucket Rate specified) and Firewall rules. This is typically rate limiting. When Flow Class is checked for a field, if a packet has matched a rule (either Flow Control or Firewall types), these fields are stored in the Flow Class entry. A Flow Class entry is used by the system for aggregating a set of flows so that they can be subjected to similar behavior, be it dropping the packets, or rate limiting them.

    For example, if a rule has a Src IP address of 0.0.0.0 and the Flow Class box checked, and Token Bucket Rate set to 10 kbytes/sec, all packets passing through the system must match this rule, and each flow will be allowed a maximum throughput of 10000 bytes/sec. If the rule were to have Src IP address of 10.0.0.10 and the Flow Class box checked, with a Token Bucket Rate of 10 kbytes/sec, all packets coming from a machine with IP address 10.0.0.10, must match this rule, and the cumulative throughput allowed for this machine shall be no more than 10000bytes/sec. Also see **More About the Match Checkbox and Flow Class Checkbox**.

26. To add the QoS rule, click **OK**.

 © 2012 Meru Networks, Inc.

More About the Match Checkbox and Flow Class Checkbox

The two checkboxes Match and Flow Class operate independently from each other; they perform two different functions. Match will almost always be used because checking this box indicates that the setting on the left must match - this sets the matching criteria for the QoS rule. You can check more than one matching criteria. Matching is the first phase of QoS rule execution - see the green box in **Figure 35**.

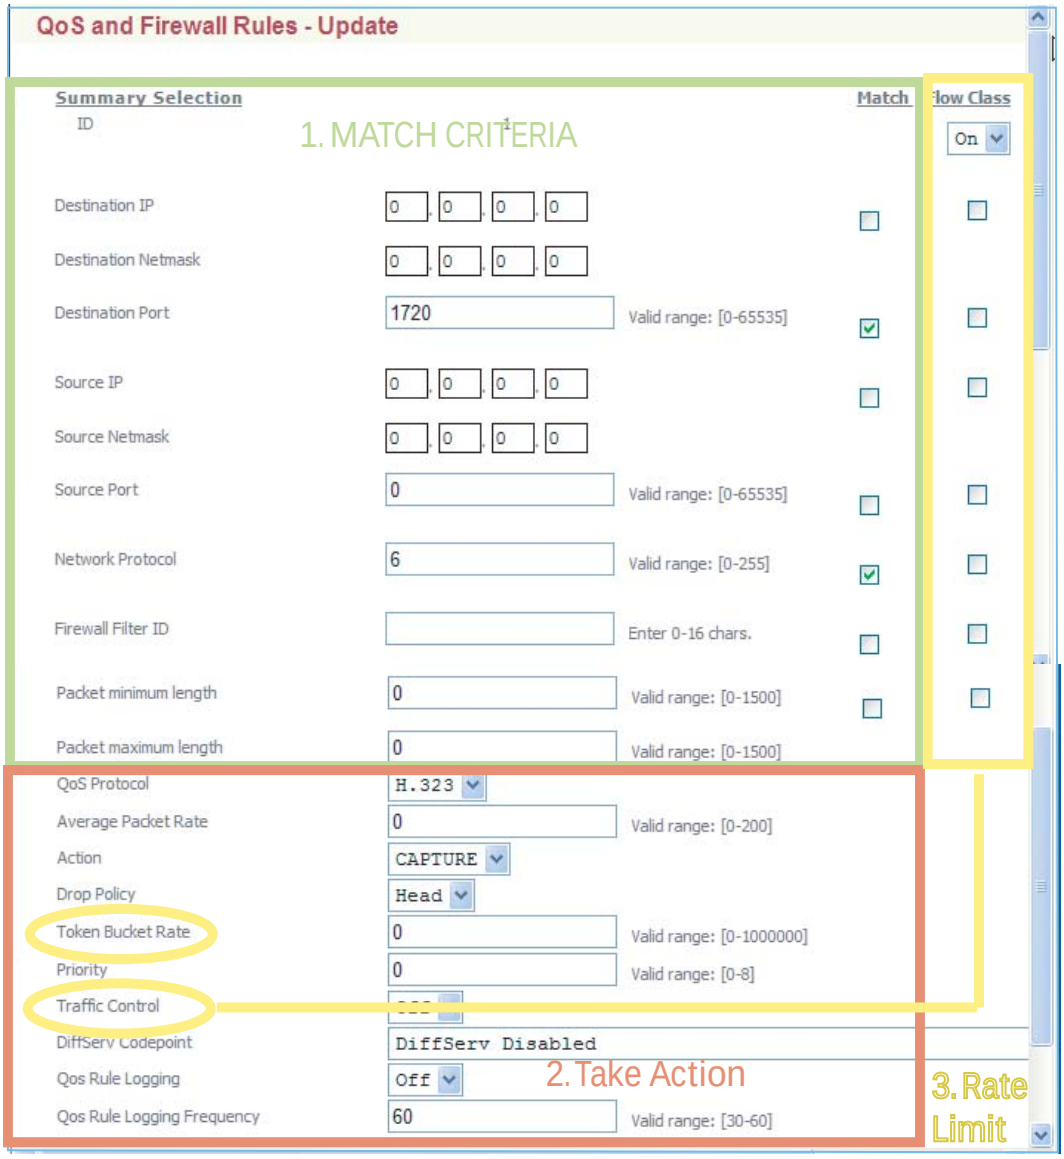
After criteria are matched, the action phase of the QoS rule is executed. This phase is enclosed in the orange box in **Figure 35**. Here are the directions that describe what to do with the matched packet from phase 1, Matching. For example, the rule can capture the packet from a named source and drop it. Action is phase 2 of QoS rule execution.

The Flow Class column is all about rate limiting. If a rule involves rate limiting, the actions **Traffic Control** and **Token Bucket Rate** must have been turned on. When the QoS rule executes traffic control, it looks at the check marks in the flow class column. If there are no check marks at all, the rate limiting is applied to everything. If Destination, Source, or Network Protocol have Flow Class checked, the following happens:

- Destination Flow Class - Each destination flow is limited to the rate.
- Source Flow Class - All source flows combined must be less than or equal to the rate.
- Network Protocol Flow Class - Any data transported using this protocol is limited to the rate.

© 2012 Meru Networks, Inc.

Figure 35: How QoS Rules Work



Note: During creation of a QoS rule, at least one Match Flow flag must be selected or else the system will not allow the user to proceed.

© 2012 Meru Networks, Inc.

Configuring QoS Rules With the CLI

To configure QoS rules with the CLI, you need to be in QoS Rule configuration mode. Enter **`configure terminal`**, then specify a QoS rule with the command **qosrule <*rule-id*>.** See the chart below for the options for these two commands.

Command	Purpose
`configure terminal`	Enter global configuration mode.
`qosrule` *`rule-id`* **`netprotocol`** {**`6`**|**`17`**|***`protocolnumber`***} **`qosprotocol`** {**`H323v1`**|**`sip`**|**`none`**}	Enter QoS Rule configuration for the specified rule ID. Use **show qosrules** to obtain a list of rule IDs. The required parameters are: • **netprotocol**: The network protocol is a standard network protocol number such as **6** for TCP or **17** for UDP. It can be any valid protocol number such as **119** for the SVP protocol, used with Spectralink phones. [Full listing at: http://www.iana.org/assignments/protocol-numbers] • **qosprotocol**: The QoS protocol. This can be one of the following: — **H323v1** (H.323v1) — **sip** (SIP - Session Initiation Protocol) — **none** (Used to denote all other protocols)
`... commands ...`	Enter the QoS rule configuration commands here (see the following table).
`end`	Return to privileged EXEC mode.
`copy running-config startup-config`	This is an optional step to save your entries in the configuration file.

Commands for QoS Rule CLI Configuration

Once you are in QoS rule configuration mode (see directions above), you can issue any of these QoS rule configuration commands:

© 2012 Meru Networks, Inc.

Command	Purpose
dstip *ip*	Destination IP in the format 255.255.255.255.
dstmask *ipmask*	Destination netmask in the format 255.255.255.255
dstport *port*	Destination port number from 0 to 65535.
srcip *ip*	Source IP in the format 255.255.255.255.
srcmask *ipmask*	Source netmask in the format 255.255.255.255.
srcport *port*	Source port number from 0 to 65535.
action {**forward** | **capture** | **drop**}	Action to take for packets matching the rule. This can be one of the following: • **forward**—A flow is given an explicit resource request, bypassing the QoS protocol detector and regardless of whether a QoS protocol was specified. • **capture**—The flow is passed through the QoS protocol detector, using the specified QoS protocol. This is the recommended action for static QoS rules that are H.323v1/SIP based. • **drop**—The flow is dropped.
droppolicy {**head** | **tail**}	The drop policy. This can be one of the following: • **head**—Drop the entry at the head of the list. • **tail**—Drop the entry at the tail of the list. This is the default setting.
dscp *class*	The DiffServ codepoint class. This lets you choose a per-hop forwarding behavior for the packets in the flow. It is recommended that you be familiar with RFCs 2475 and 2597 before changing these values.
priority *rate*	The number (0-8) that specifies best effort priority queue, where 0 is default (best-effort) and 8 is highest priority. Priority may be turned on (non-zero) or the average packet rate and TSpec token bucket rate may be specified, but not both. Defaults to 0.

 © 2012 Meru Networks, Inc.

Command	Purpose
avgpacketrate *rate*	Average packet rate: from 0 to 200 packets per second. If this is a non-zero value, then the TSpec token bucket rate must also be a non-zero value, and priority cannot be set to a non-zero value. Defaults to 0.
tokenbucketrate *rate*	TSpec token bucket rate, from 0 to 1000 Kbps or 1-64 Mbps, depending on the box checked. If this is a non-zero value, then the average packet rate must also be non-zero, and the priority cannot be set to a non-zero value. Defaults to 0.
trafficcontrol-enable	Turns traffic control policing on. When traffic control is on, traffic assigned a priority will travel at the assigned rate and no faster.
no trafficcontrol	Turns traffic control policing off. This is the default setting.

QoS Rule CLI Configuration Example

The following commands configure QoS rule 10 for the set of IP phones whose server is at the IP address 10.8.1.1:

```
controller (config)# qosrule 10 netprotocol 17 qosprotocol none
controller (config-qosrule)# srcip 10.8.1.1
controller (config-qosrule)# srcmask 255.255.255.0
controller (config-qosrule)# srcport 0
controller (config-qosrule)# dstip 10.8.1.1
controller (config-qosrule)# dstmask 255.255.255.0
controller (config-qosrule)# dstport 0
controller (config-qosrule)# action forward
controller (config-qosrule)# droppolicy head
controller (config-qosrule)# tokenbucketrate 9400
controller (config-qosrule)# avgpacketrate 35
controller (config-qosrule)# end
```

When SCCP phones are used, we recommend that you create a separate VLAN for the SCCP phones and create the following qosrules for G.711 (20ms) codec to handle qosflow traffic:

```
controller (config)# qosrule 123 netprotocol 17 qosprotocol none
controller (config-qosrule)# srcmask subnet_mask (for example, 255.255.192.0)
controller (config-qosrule)# srcip subnet_IP_addr (for example,172.27.128.0)
controller (config-qosrule)# action forward
controller (config-qosrule)# avgpacketrate 50
controller (config-qosrule)# tokenbucketrate 10000
controller (config-qosrule)# droppolicy head
controller (config-qosrule)# exit

controller (config)# qosrule 124 netprotocol 17 qosprotocol none
```

© 2012 Meru Networks, Inc.

```
controller (config-qosrule)# dstip subnet_IP_addr  (for example,172.27.128.0)
controller (config-qosrule)# dstmask subnet_mask (for example, 255.255.192.0)
controller (config-qosrule)# action forward
controller (config-qosrule)# avgpacketrate 50
controller (config-qosrule)# tokenbucketrate 10000
controller (config-qosrule)# droppolicy head
controller (config-qosrule)# exit
```

The following example configures a QoS rule for a 1 Mbps CBR-encoded video streamed from Windows Media Server 9 over UDP transport.

The following lists the example's configuration parameters:

- Rule ID: 11
- Network protocol: 17 (UDP)
- QoS protocol: None
- Source IP address: 0.0.0.0
- Source subnet mask: 0.0.0.0
- Source port: 0
- Destination IP address:10.10.43.100 (This is the IP address of the wireless station receiving the video stream.)
- Destination subnet mask: 255.255.255.255
- Destination port: 5004
- Action to take if packets match rule: Forward
- Drop policy: Head
- Token bucket rate: 128 kbytes/second
- Average packet rate: 10 packets/second

The following commands configure the QoS rule for the video streamed from Windows Media Server 9 over UDP transport:

```
controller (config)# qosrule 11 netprotocol 17 qosprotocol none
controller (config-qosrule)# srcip 0.0.0.0
controller (config-qosrule)# srcmask 0.0.0.0
controller (config-qosrule)# srcport 0
controller (config-qosrule)# dstip 10.10.43.100
controller (config-qosrule)# dstmask 255.255.255.255
controller (config-qosrule)# dstport 0
controller (config-qosrule)# action forward
controller (config-qosrule)# droppolicy head
controller (config-qosrule)# tokenbucketrate 128000
controller (config-qosrule)# avgpacketrate 10
controller (config-qosrule)# end
```

Optimizing Voice Over IP

Transmitting voice over IP (VoIP) connections is, in most senses, like any other network application. Packets are transmitted and received from one IP address to another. The voice is encoded into binary data at one end and decoded at the other end. In some sense, voice is just another form of data. However, there are a few special problems.

The requirements for quality voice traffic are not exactly the same as the requirements for most data traffic:

- If a data packet arrives a second late, it is usually of no consequence. The data can be buffered until the late packet is received. If a voice packet arrives a second late, it is useless and might as well be thrown away.
- If a data packet takes a third of second to arrive at the destination, that is usually fast enough. If voice packets routinely take a third of a second to arrive, the users will begin to take long pauses between sentences to make sure that they don't interfere with the other person's speech.

Quality VoIP calls need voice data to be delivered consistently and quickly. Meeting the requirements of VoIP data requires either a connection with plenty of bandwidth all along the data route or a means of ensuring a certain quality of service (QoS) for the length of the call.

Even if the bandwidth is available, setting up the phone call can be a nontrivial task. When a phone call is initiated, the destination of the call might be a standard telephone on the public switched network, an IP-to-voice device at a particular IP number, or one of several computers (for example, systems at home or the office and a laptop used by an individual). If the destination device is a phone on the public network, the initiation protocol must locate a gateway between the Internet and the telephone network. If the destination is a person, the initiation protocol must determine which computer or device to call.

After the destination device has been found, the initiating and the destination devices must negotiate the means of coding and decoding the voice data. This process of finding a destination device and establishing the means of communication is called *session initiation*.

The two main standards for initiating voice sessions:

- Session Initiation Protocol, or SIP, used for most VoIP telephone calls.
- H.323v1, used for multimedia communication, for example by Microsoft NetMeeting.

In both cases, the initiating device queries a server, which then finds the destination device and establishes the communications method.

After the two devices have been matched and the communication standards chosen, the call proceeds. The server may remain in the communication loop (H.323v1) or it may step out of the loop (SIP).

© 2012 Meru Networks, Inc.

In practice, this means that if your VoIP devices are configured correctly, that is, if they know how to find their SIP or H.323v1 server and the servers understand how to find them, then the VoIP devices should work when communicating over the Meru Meru Wireless LAN System without any special configuration.

Using Meru Wireless LAN System QoS Rules for VoIP

As discussed in the previous section, quality voice traffic has different network requirements than does typical network traffic. The Meru Wireless LAN System is designed to automatically provision voice traffic with a level of QoS appropriate for voice calls. The result is that VoIP traffic works much better over a Meru Meru Wireless LAN System than it does over most WLANs.

The controller watches the traffic passing through it and when it sees packets from stations to servers on ports reserved for SIP or H.323v1 service, it tracks subsequent communication in that sequence and provisions the VoIP call with a level of service appropriate for a VoIP call.

The port numbers watched are:

- 5060 for SIP service (UDP or TCP)
- 1720 for H.323v1 service (TCP)
- 5200 for Vocera (UDP)

These are the standard port numbers for these services. If your VoIP devices use these ports to communicate with their servers, you do not need to configure VoIP QoS rules on your system.

If your VoIP devices and servers are configured to use different ports, you will need to modify the QoS rules on the controller to match the ports your system uses. Change QoS rules with either the Web UI or the CLI.

Modifying QoS Rules for Nonstandard Ports

The controller is pre-configured to detect the bandwidth requirements for a SIP or H.323v1 call and make a bandwidth reservation. Change QoS rules with either the Web UI or the CLI. The following default QoS rules are configured at the factory:

```
default(15)# show qosrule

ID    Dst IP          Dst Mask        DPort Src IP          Src Mask        SPort Prot
   Firewall Filter Qos   Action   Drop

1    0.0.0.0       0.0.0.0       1720  0.0.0.0       0.0.0.0       0    6
   h323  capture  head
2    0.0.0.0       0.0.0.0       0    0.0.0.0       0.0.0.0       1720  6
   h323  capture  head
3    0.0.0.0       0.0.0.0       5060  0.0.0.0       0.0.0.0       0    17
   sip   capture  head
5    0.0.0.0       0.0.0.0       5060  0.0.0.0       0.0.0.0       0    6
   sip   capture  head
```

 © 2012 Meru Networks, Inc.

```
7    0.0.0.0       0.0.0.0       5200  0.0.0.0       0.0.0.0       0    17
   other forward  head
8    0.0.0.0       0.0.0.0       0    0.0.0.0       0.0.0.0       5200  17
   other forward  head

        QoS and Firewall Rules(6 entries)
```

The first two pre-configured QoS rules give priority to H.323v1 traffic sent to and from TCP port 1720 respectively. The next two QoS rules give priority to SIP traffic sent to and from UDP/TCP port 5060 respectively. Rules 7 and 8 are for Vocera badges and use port 5200 with UDP.

You normally do not need to configure QoS rules in the controller, unless you have special requirements in your configuration. For example:

- You want to drop packets coming from certain ports or IP addresses.
- You want to configure the controller to give priority to traffic other than H.323v1 and SIP traffic.

You can configure rules to provide priority-based or reserved QoS. QoS is applied with reserved traffic being allocated the first portion of total bandwidth, followed by fixed priority levels, and finally by the best-effort (default) traffic class. You can configure reserved QoS for new applications using the average packet rate and token bucket rate parameters together as the traffic specification (also called TSpec in IETF IntServ RFCs).

Global QoS Settings

Global QoS parameters configure settings that determine call quality on a global level. These settings allow you to fine tune Call Admission Control (CAC), client load balancing, bandwidth scaling, and time-to-live settings.

You can configure the following global quality-of-service parameters:

Table 18: Global Quality-of-Service Parameters

Command	Purpose
qosvars admission { **admitall** | **pending** | **reject** }	Admission control. Valid values are **admitall**, **pending**, and **reject**.
qosvars ttl *ttl-value*	Default time-to-live in seconds for all other protocols besides TCP and UDP.

© 2012 Meru Networks, Inc.

Table 18: Global Quality-of-Service Parameters

Command	Purpose
qosvars tcpttl *ttl-value*	Time-to-live for TCP protocol, in seconds.
qosvars udpttl *ttl-value*	Time-to-live for UDP protocol, in seconds.
qosvars bwscaling *value*	Scale factor for Tspec bandwidth, in percent. May range from 1% to as high as 100% ; 100% is typical
qosvars cac-deauth {**on** | **off**}	Configures the optional 802.11 de-authentication behavior.
qosvars calls-per-ap *max*	Configures the maximum number of calls per AP.
qosvars calls-per-bssid *max*	Configures the maximum number of calls per BSSID.
qosvars drop-policy {**head**|**tail**}	Configures the drop policy. Valid values are **head** or **tail** respectively.
qosvars load-balance overflow {**on** | **off**}	Enables and disables load balancing across BSSIDs.
qosvars max-stations-per-ap *max*	Configures the maximum stations (0-128) allowed to associate with an AP. 128 is the default. We recommend planning for about 50 clients per AP300/AP400 radio (or per interference region) if you plan to use Virtual Port and plan to have phones as clients. For a data-only installation, plan up to 128 clients per radio, meaning 256 for AP320/AP400 and 128 for other AP300 models. The maximum clients per radio on AP150/AP180 for a data-only installation is 62. AP1000 supports up to 20 data clients per radio. Refer to the Meru Deployment Guides on the support site for more information.
qosvars max-stations-per-bssid *max*	Configures the maximum stations (0-1023) allowed to associate with an BSSID.
qosvars no enable	Turns off QoS.
SIP Idle Timeout	Sets the time period after which an idle SIP connection will time out.

 © 2012 Meru Networks, Inc.

Table 18: Global Quality-of-Service Parameters

Command	Purpose
Station Assignment Aging Time (s)	Sets the time period after which stations will begin aging out.
Maximum Calls Per Interference Region	Specifies the number of calls that are permitted in a given interference area.

Rate Limiting QoS Rules

Rate limiting controls the overall traffic throughput sent or received on a network interface. A specific bandwidth limit can be set for a network or device; then, if the actual traffic violates that policy at any time, the traffic is shaped in some way. In this implementation, packets are dropped until the traffic flow conforms to the policy with some queuing (delaying packets in transit) applied.

Rate Limiting with the CLI

You can rate limit traffic by turning on Traffic Control and using the Token Bucket Rate as the token bucket limiter. Follow these steps to rate limit the client 10.11.31.115 to approximately 3Mbps and then run a quick test to verify functionality.

1. Determine the token bucket rate to achieve the desired rate limit. In the example below, we'll limit it to 3Mbps (3Mbps = 3000000bps. 3000000/8/8=46875).
2. Create a qosrule that does rate limiting for a client.

```
Controller1# sh qosrule 23
   QoS and Firewall Rules
ID : 23
   Id Class flow class : on
   Destination IP : 10.11.31.115 (this is the client to be rate limited)
   Destination IP match : on
   Destination IP flow class : on
   Destination Netmask : 255.255.255.255
   Destination Port : 0
   Destination Port match : none
   Destination Port flow class : none
   Source IP : 0.0.0.0
   Source IP match : none
   Source IP flow class : none
   Source Netmask : 0.0.0.0
   Source Port : 0
   Source Port match : none
```

© 2012 Meru Networks, Inc.

```
Source Port flow class : none
Network Protocol : 6
Network Protocol match : on
Network Protocol flow class : on
Firewall Filter ID :
Filter Id match : none
Filter Id Flow Class : none
Packet minimum length : 0
Packet Length match : none
Packet Length flow class : none
Packet maximum length : 0
QoS Protocol : other
Average Packet Rate : 0
Action : forward
Drop Policy : head
Token Bucket Rate : 46875
Priority : 0
Traffic Control : on
DiffServ Codepoint : disabled
Qos Rule Logging : on
Qos Rule Logging Frequency : 31
```

Rate Limiting QoS Rules with the GUI

You can rate limit traffic for a single user by turning on Traffic Control and using the Token Bucket Rate as the token bucket limiter. Follow these steps to rate limit the traffic:

1. Click **Configure > QoS > System Settings > QoS and Firerules** tab **> Add**. The QoS and Firerules Add window displays.
2. Scroll down to the lower half of the QoS and Firerules Add window.
3. Set Traffic Control **On**.
4. Set the token bucket rate to achieve the desired rate limit. This can be entered in either Kbps (from 0-1000) or Mbps (from 0-64), depending on the needs of your deployment.
5. Click **OK**.

The rate limit is now set.

Rate Limiting Examples

Rate-Limit Clients in the Same Subnet for TCP

To rate-limit clients from the subnet 10.11.31.0, follow these steps:

1. Determine the token bucket rate to achieve the desired rate limit. In the example below, we'll limit it to 3Mbps (3Mbps = 3000000bps. 3000000/8/8=46875).
2. Create the following qosrule to rate-limit clients from a particular subnet:

 © 2012 Meru Networks, Inc.

```
Controller1# sh qosrule 23
QoS and Firewall Rules
ID: 23
ID Class flow class : on
Destination : 10.11.31.0 (this is the subnet to be rate limited)
Destination IP match : on
Destination IP flow class : on
Destination Netmask : 255.255.255.0
Destination  Port  : 0
Destination  Port  match : none
Destination  Port  flow class : none
Source IP : 0.0.0.0
Source Netmask : 0.0.0.0
Source  Port  : 0
Source  Port  match : none
Source  Port  flow class : none
Network Protocol : 6
Network Protocol match : on
Network Protocol flow class : on
Firewall Filter ID :
Filter Id match : none
Filter Id Flow Class : none
Packet minimum length : 0
Packet Length match : none
Packet Length flow class : none
Packet maximum length : 0
QoS Protocol : other
Average Packet Rate : 0
Action : forward
Drop Policy : head
Token Bucket Rate : 46875
Priority : 0
Traffic Control : on
DiffServ Codepoint : disabled
Qos Rule Logging : on
Qos Rule Logging Frequency : 60
```

3. Configure Chariot to send a TCP downstream to the client 10.11.31.115 using the throughput script. You should see throughput averaging around3Mbps on Chariot.

As a result of this QoS rule, each client in the 10.11.31.xxx network will get approximately get 3 mbps from each individual source in the same subnet.

Rate-Limit Clients From Different Subnets for TCP

To rate-limit clients from any subnet other than the one that those clients are currently using, follow these steps:

1. Determine the token bucket rate to achieve the desired rate limit. In the example below, we'll limit it to 3Mbps (3Mbps = 3000000bps. 3000000/8/8=46875).
2. Create the following qosrule to rate-limit clients from a particular subnet:

```
Controller1# sh qosrule 23
QoS and Firewall Rules
ID : 23
```

© 2012 Meru Networks, Inc.

```
Id Class flow class : on
Destination IP : 10.11.31.0 (this is the subnet to be rate limited)
Destination IP match : on
Destination IP flow class : none
Destination Netmask : 255.255.255.0
Destination  Port  : 0
Destination  Port  match : none
Destination  Port  flow class : none
Source IP : 0.0.0.0
Source Netmask : 0.0.0.0
Source  Port  : 0
Source  Port  match : none
Source  Port  flow class : none
Network Protocol : 6
Network Protocol match : on
Network Protocol flow class : on
Firewall Filter ID :
Filter Id match : none
Filter Id Flow Class : none
Packet minimum length : 0
Packet Length match : none
Packet Length flow class : none
Packet maximum length : 0
QoS Protocol : other
Average Packet Rate : 0
Action : forward
Drop Policy : head
Token Bucket Rate : 46875
Priority : 0
Traffic Control : on
DiffServ Codepoint : disabled
Qos Rule Logging : on
Qos Rule Logging Frequency : 60
```

3. Configure Chariot to send a TCP downstream to the different clients in 10.11.31.xxx using the throughput script.

All the clients in 10.11.31.xxx network should now share the 3 Mbps from each individual source.

Configuring Codec Rules

Codec rules are configurable and can be specified with the commands in this section.

Note: If your SIP phones support "ptime" then you will not need to configure any codec rules. Otherwise, you should configure QoS rules and ensure the rule you set is based on the packetization/sample rate that the phone uses.

 © 2012 Meru Networks, Inc.

The SIP *ptime* attribute is an optional part of the SIP Specification. It allows a SIP media device to advertise, in milliseconds, the packetization rate of the RTP media stream. For example, if ptime is set to the value “20” the SIP device sends 1 RTP packet to the other party every 20 milliseconds. With this specification, the Meru Meru Wireless LAN System can accurately reserve QoS bandwidth based on the Codec and Packetization rate.

The following is a sample of the "ptime" attribute included as part of an SDP media attribute:

```
m=audio 62986 RTP/AVP 0
a=rtpmap:0 PCMU/8000
a=ptime:20
```

If the ptime attribute is not present when the media is negotiated in SDP between the SIP devices, the Meru Meru Wireless LAN System uses the default value of the **codec** *type* specified with the **qoscodec** command.

Note: The proper packetization rate must be configured to match the actual media traffic or the QoS reservation will be inaccurate. A spreadsheet, `qoscodec_parameters.xls`, is available from the Customer Support FTP site that can help you to determine the correct values for the relevant parameters. Please contact Customer Support for details and access.

To configure QoS Codec rules, you need to enter Codec configuration mode. To do this, follow these steps:

© 2012 Meru Networks, Inc.

Command	Purpose
configure terminal	Enter global configuration mode.
qoscodec *rule-id* **codec** *type* **qosprotocol** {**H323v1|sip|none**} **tokenbucketrate** *tbr* **maxdatagramsize** *maxdg* **minpolicedunit** *minpol* **samplerate** *sr*	Enter QoS Codec configuration for the specified rule ID. Use **show qoscodec** to obtain a list of rule IDs. The following are the required parameters: • **codec**. Enter the Codec type after at the Codec keyword. The acceptable Codec types are given below. • **qosprotocol**. The QoS protocol. This can be one of the following: **H323v1** (H.323v1); **sip** (SIP - Session Initiation Protocol); **none**. This is used to denote all other protocols. • **tokenbucketrate**. Token bucket rate, from 0 to 1000 Kbps or 1-64 Mbps, depending on the box checked. • **maxdatagramsize**. Maximum datagram size. From 0 to 1,500 bytes. • **minpolicedunit**. Minimum policed unit. From 0 to 1,500 bytes. • **samplerate**. Sample rate. From 0 to 200 packets per second.
... *commands* ...	Enter the QoS CODEC configuration commands here.
end	Return to privileged EXEC mode.
copy running-config startup-config	This is an optional step to save your entries in the configuration file.

The Codec type can be one of the following

Type	Description
1016	1016 Audio: Payload Type 1, Bit Rate 16 Kbps
default	Contains the default TSpec/ RSpec for unknown codecs or codecs for which there is no entry in the codec translation table
dv14	DV14 Audio: Payload Type 5, Bit Rate 32 Kbps

 © 2012 Meru Networks, Inc.

Type	Description
dv14.2	DV14.2 Audio: Payload Type 6, Bit Rate 64Kbps
g711a	G711 Audio: Payload Type 8, G.711, A-law, Bit Rate 64 Kbps
g711u	G711 Audio: Payload Type 0, G.711, U-law, Bit Rate 64 Kbps
g721	G721 Audio: Payload Type 2, Bit Rate 32 Kbps
g722	Audio: Payload Type 9, Bit Rate 64 Kbps, 7KHz
g7221	G7221 Audio: Payload Type *, Bit-Rate 24 Kbps, 16KHz
g7221-32	G7221 Audio: Payload Type *, Bit-Rate 32 Kbps, 16KHz
g723.1	G7231 Audio: Payload Type 4, G.723.1, Bit Rate 6.3Kbps
g728	G728 Audio: Payload Type 15, Bit Rate 16Kbps
g729	G729 Audio: Payload Type 16, Bit Rate 8Kbps
g7red	Proprietary MSN Codec Audio: Payload Type *
gsm	GSM Audio: Payload Type 3, Bit Rate 13Kbps
h261	H.261 Video
h263	H.263 Video
lpc	IPC Audio: Payload Type 7, Bit Rate 2.4 Kbps
mpa	MPA Audio: Payload Type 14, Bit Rate 32 Kbps
siren	Proprietary MSN Audio: Payload Type *, Bit Rate 16Kbps, 16KHz

The following commands are used in the QoS Codec configuration mode:

© 2012 Meru Networks, Inc.

Table 19: QoS CODEC Configuration Mode Commands

Command	Purpose
tokenbucketsize *size*	Token bucket size in bytes. From 0 to 16,000 bytes. Defaults to 8.
peakrate *rate*	Traffic spec peak rate. From 0 to 1,000,000 bytes/second. Defaults to 0.
rspecrate *rate*	Reservation spec rate. From 0 to 1,000,000 bytes/second. Defaults to 0.
rspecslack *slack*	Reservation spec slack. From 0 to 1,000,000 microseconds. Defaults to 0.

QoS Statistics Display Commands

Displaying Phone/Call Status

To display the active SIP phones that have registered with a SIP server, use the **show phones** command.

```
Controller(15)# show phones

MAC               IP             AP ID AP Name        Type Username          Server
   Transport

00:01:3e:12:24:b5   172.18.122.21    3     QoS-Lab         sip  100 172.18.122.122   udp

        Phone Table(1 entry)

Controller(15)#
```

To display the active SIP phone calls, use the **show phone-calls** command.

```
controller# sh phone-calls

From MAC            From IP          From AP From AP Name    From Username       From Flow
   Pending   To MAC             To IP           To AP   To AP Name      To Username
   To Flow   Pending   Type State
```

 © 2012 Meru Networks, Inc.

```
00:0f:86:12:1d:7c   10.0.220.119     1       AP-1            5381                100
   off       00:00:00:00:00:00   10.0.220.241     0                     69
   101       off       sip  connected
        Phone Call Table(1 entry)
controller#
```

Displaying Call Admission Details

To view the current calls supported by APs, use the **show statistics call-admission-control ap** command.

```
controller# show statistics call-admission-control ap
AP ID Current Calls Cumulative Rejected Calls
6     0             0
Call Admission Control AP Statistics(1 entry)
```

To show calls in relation to specific BSSIDs, use the **show statistics call-admission control bss** command.

```
controller# show statistics call-admission-control bss

BSSID             Current Calls Cumulative Rejected Calls

00:0c:e6:13:00:da 0             0
00:0c:e6:52:b3:4b 0             0
00:0c:e6:f7:42:60 0             0
        Call Admission Control BSS Statistics(3 entries)
```

More QoS Rule Examples

The following are in addition to the previous examples in this chapter, **QoS Rule CLI Configuration Example** and **Rate Limiting Examples**:

- **Rate-Limit a Certain Client**
- **Wireless Peer-to-Peer Qos Rules**

Rate-Limit a Certain Client

To rate-limit the client 10.11.31.115 from any source, follow these steps:

1. Determine the token bucket rate to achieve the desired rate limit. In the example below, we'll limit it to 3Mbps (3Mbps = 3000000bps. 3000000/8/8=46875).
2. Create the following qosrule to rate-limit a particular client from any source:

```
Controller1# sh qosrule 23
QoS and Firewall Rules
```

© 2012 Meru Networks, Inc.

```
ID : 23
ID Class flow class : on
Destination IP : 10.11.31.115 (this is the client to be rate limited)
Destination IP match : on
Destination IP flow class : on
Destination Netmask : 255.255.255.255
Destination Port : 0
Destination Port match : none
Destination Port flow class : none
Source IP : 0.0.0.0
Source Netmask : 0.0.0.0
Source Port : 0
Source Port match : none
Source Port flow class : none
Network Protocol : 6
Network Protocol match : on
Network Protocol flow class : on
Firewall Filter ID :
Filter Id match : none
Filter Id Flow Class : none
Packet minimum length : 0
Packet Length match : none
Packet Length flow class : none
Packet maximum length : 0
QoS Protocol : other
Average Packet Rate : 0
Action : forward
Drop Policy : head
Token Bucket Rate : 46875
Priority : 0
Traffic Control : on
DiffServ Codepoint : disabled
Qos Rule Logging : on
Qos Rule Logging Frequency : 60
```

3. Configure Chariot to send a TCP downstream to the client (10.11.31.115) using the throughput script.

You should see throughput averaging around 3Mbps on Chariot. As a result of this QoS rule, when the client 10.11.31.115 receives traffic, it will be rate-limited to approximately 3mbps.

Wireless Peer-to-Peer Qos Rules

In general, to create a priority QoS rule for a particular protocol between two IP addresses, specify the network protocol and then select the match flow for the protocol. This creates QoS priority for a particular protocol between the IP's.

Prioritize Peer-to-Peer

This particular IP-Based QoS rule prioritizes peer-to-peer traffic generated from 172.18.85.11 and destined to 172.18.85.12.

```
Testing# show qosrule 11
```

 © 2012 Meru Networks, Inc.

```
QoS and Firewall Rules
ID : 11
Id Class flow class : on
Destination IP : 172.18.85.12
Destination IP match : on
Destination IP flow class : none
Destination Netmask : 255.255.255.255
Destination Port : 0
Destination Port match : none
Destination Port flow class : none
Source IP : 172.18.85.11
Source Netmask : 255.255.255.255
Source IP match    : on
Source IP flow class : none
Source Port : 0
Source Port match : none
Source Port flow class : none
Network Protocol : 0
Network Protocol match : none
Network Protocol flow class : none
Firewall Filter ID :
Filter Id match : none
Filter Id Flow Class : none
Packet minimum length : 0
Packet Length match : none
Packet Length flow class : none
Packet maximum length : 0
QoS Protocol : none
Average Packet Rate : 100
Action : forward
Drop Policy : head
Token Bucket Rate : 1000000
Priority : 0
Traffic Control : off
DiffServ Codepoint : disabled
Qos Rule Logging : on
Qos Rule Logging Frequency : 31
```

Peer-to-Peer Blocking

In this peer-to-peer blocking example, rules 60 and 61 apply to an isolated WLAN for guest internet access where the DNS server is actually on that network. Rules 60 and 61 are only needed if the DNS server for the wireless clients is on the same subnet as the clients themselves.

```
ID    Dst IP          Dst Mask        DPort Src IP          Src Mask        SPort Prot

802.11n Video Service Module (ViSM)

Video streaming has the low latency and loss requirements of voice with the high-throughput requirements of data. The Meru Networks Video Service Module™ (ViSM) is an optional licensed software module that delivers predictable 802.11 video performance with minimal delay, latency and jitter. Sustainable high data rates, even in mixed traffic, are supported along with synchronization of video and audio transmissions.

ViSM also introduces additional mechanisms for optimizing unicast and multicast video such as application aware scheduling, voice/video synchronization, and client-specific multicast group management. Features include the following:

- High throughput with low burstiness offers predictable performance and consistent user experience
- Application-aware prioritization synchronizes the voice and video components of a video stream, adapting the delivery of each frame based on its importance to the application.
- Multicast group management optimizes delivery to only those Virtual Ports whose clients are members of the multicast group.
- Seamless video-optimized handoff proactively reroutes the multicast delivery tree to prevent lost video frames during a transition between access points and ensures zero loss for mobile video.
- User and role based policy enforcement provides granular control over application behavior.
- Visualization reveals which clients are running which applications.

Implementing ViSM

Virtual Port already changes multicast to unicast transmissions (for non-U-APSD clients). ViSM adds per-client IGMP Snooping to the transmission. Therefore, to implement ViSM, turn on IGMP Snooping. CLI commands control IGMP snooping (see *Meru System Director Command Reference*). At this time, ViSM licensing is not enforced. ViSM is not recommended for AP1000 access points.

© 2012 Meru Networks, Inc.

Configuring Call Admission Control and Load Balancing with the CLI

To help shape a global Quality of Service for calls and traffic, Call Admission Control (CAC) and client load balancing can be set per AP or BSSID.

CAC commands can set threshold levels for the number of new SIP connections (calls) that can exist per AP or BSSID to ensure a global amount of bandwidth is available. The result is that existing calls maintain a consistent level of service, even if new calls have to be temporarily denied. When CAC is enabled, as the set call level threshold is neared for the AP or BSSID, the admin can configure actions to occur such as having the system send a 486_BusyHere response, a modified INVITE message to the ipPathfinder, or alternatively, sending a 802.11 De-authentication message the originator of the call. If an existing call moves to another AP without sufficient bandwidth, the call is classified as Pending/Best-effort until the needed resources are available.

Note: A unique CAC value can be configured for an ESSID, that affects only only that ESSID. Setting CAC at the ESSID level takes precedence over the global settings described in this section. To configure CAC for an ESSID, see “Configuring CAC for an ESSID AP with the CLI” on page 60.

Enabling client load balancing implements round-robin load balancing of client associations for an AP or BSSID. When the maximum number of stations are associated, new stations are allowed to join in a round-robin fashion.

The following commands enable CAC and limits the number of calls per AP to 12:

```
controller (config)# qosvars cac-deauth on
controller (config)# qosvars calls-per-ap 12
```

The following commands enable client load balancing overflow protection and sets the maximum number of stations per AP to 15:

```
controller (config)# qosvars load-balance-overflow on
controller (config)# qosvars max-stations-per-ap 15
```

The following commands limits the number of calls per BSSID to 14 and sets the maximum number of stations per BSSID to 30:

```
controller (config)# qosvars calls-per-bssid 14
controller (config)# qosvars max-stations-per-bssid 30
```

 © 2012 Meru Networks, Inc.

Chapter 16
Wireless Backbones With Enterprise Mesh

Enterprise Mesh is an optional (separately licensed) wireless replacement for the Ethernet links connecting APs to controllers. Deploy the Enterprise Mesh system to replace a switched wired backbone with a completely wireless 802.11 backbone, while providing similar levels of throughput, QoS, and service fidelity. At this time, AP300/AP400 and AP100 do not support mesh.

The following are Enterprise Mesh features:

- Hierarchical bandwidth architecture
- Dynamic allocation and balancing of the RF spectrum
- Full duplex capability
- Extend virtual cell, QoS, and RF coordination over backbone
- Wireless DS-to-DS (WDS) encapsulation of the Enterprise Mesh traffic
- Backhaul 3DES encryption (end-to-end), configurable per-AP
- Static hop setup in the connectivity tree
- Static backhaul channel setup
- Dataplane Encryption (affects performance because encryption/decryption is in software)

An Enterprise Mesh instance operates on a preset, static channel (by default, channel 40). The permissible channel range and maximum transmission power per channel is determined by the country code.

Wireless backhaul security supports automatic keying using Meru Networks Certificates as well as backhaul encryption. Security is supported via end-to-end 3DES data tunnel encryption between each AP and controller, as implemented with the **dataplane-encryption** command.

Enterprise Mesh Design

Enterprise Mesh is typically composed of hub-and-spoke configurations (as shown in **Figure 36**), chain configurations (as shown in **Figure 37**) or a variation of these.

Within the Enterprise Mesh, on all APs, the 802.11b/g interfaces provide connectivity for client traffic while the 802.11a radios provide wireless backhaul.

In a dense network, hub-and-spoke (all APs point to the gateway) is the best topology although collisions can occur.

© 2012 Meru Networks, Inc.

- For best performance, avoid collisions between adjacent small clouds by creating each cloud on a separate channel. A cloud is defined as a set of APs communicating along a backhaul topology path to/from a gateway AP.
- In a typical deployment, limit siblings without going to great lengths to modify power settings. Since traffic is sent unicast, some collisions will occur within the cloud, caused by siblings.

Figure 36: Enterprise Mesh Network - Hub and Spoke Design

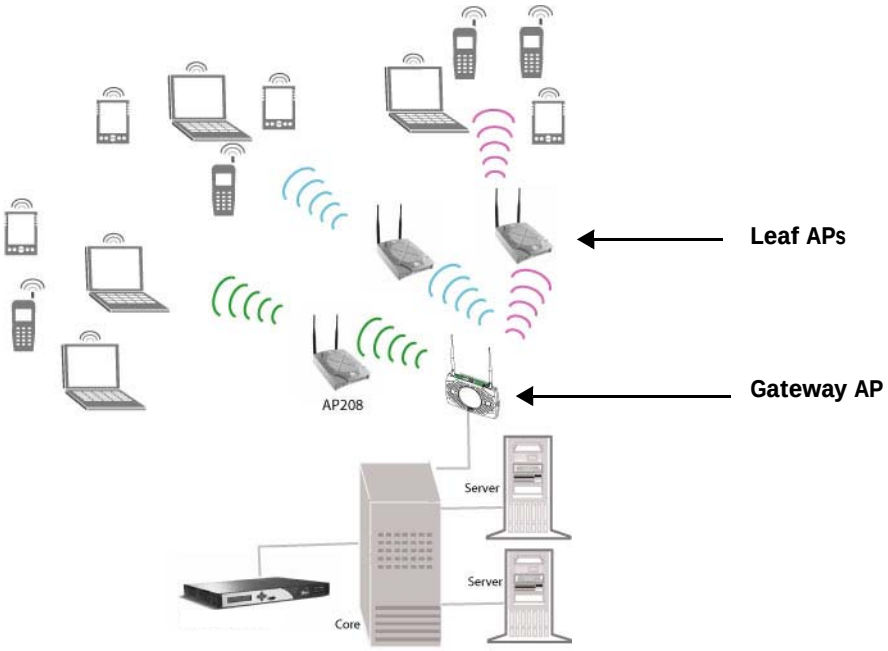

Figure 37: Three Hop Enterprise Mesh - Chain Design

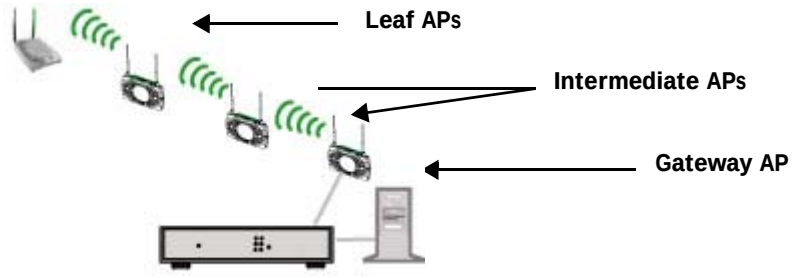


Gateway APs

A gateway AP (AP150 or OAP180) is located at the wired edge of the Enterprise Mesh network, and provides the link between wired and wireless service. The gateway AP is the only AP that has a wired connection to the network and is configured for **gateway** mode.

 © 2012 Meru Networks, Inc.

Intermediate APs

Intermediate APs (AP150 or OAP180) connect upstream to the gateway AP and downstream to other intermediate APs or leaf APs via a wireless backhaul link. Intermediate AP have no wired connection to the network and are configured for **wireless** mode.

Leaf APs

Leaf APs (AP150 or OAP180), at the edge of the Enterprise Mesh network connect upstream to a gateway or intermediate AP and provide service to 802.11 clients. Leaf APs are configured for **wireless** mode.

Equipment Requirements

When designing an Enterprise Mesh configuration, use either a MC3000, MC41000, or MC5000 controller and APs based on their capabilities, as shown in Table 20.

Table 20: AP Capabilities in an Enterprise Mesh

AP Model	Gateway	Intermediate AP	Leaf AP
AP300/AP400	Not supported	Not supported	Not supported
AP150	✓	✓	✓
RS4000	✓	✓	✓
OAP180	✓	✓	✓
AP1000	Not supported	Not supported	Not supported

The following additional design guidelines apply:

- Enterprise Mesh APs support only L2 connectivity to the controller.
- QoS is not supported on the wireless backhaul.
- Bridged mode is not supported for Enterprise Mesh—only tunneled mode is supported.
- Dynamic discovery is not supported.
- From the gateway, a maximum of 3 hops is supported between the gateway and leaf APs with no more than 7 APs per cloud, (for example,1 gateway with 2 wireless APs, and 4 leaf APs is supported).
- Minimum channel separation guidelines are to use non-overlapping channels.
- The design must have uncompromising LoS between any two backhaul hops.

Installing and Configuring an Enterprise Mesh System

Determine Antenna Placement

An Enterprise Mesh uses APs (as repeaters) to extend the range of wireless coverage. An AP in a Enterprise Mesh configuration is directed to look for a signal from a Parent AP. (A Parent-AP ID is the AP ID of the of the intermediate AP providing backhaul connectivity). As such, antenna placement and reception is important for the optimum performance of the system.

If there are obstacles in the radio path, the quality and strength of the radio signal are degraded. Calculating the maximum clearance from objects on a path is important and should affect the decision on antenna placement and height. It is especially critical for long-distance links, where the radio signal could easily be lost.

When planning the radio path for a wireless hop, consider these factors:

- Enterprise Mesh requires line-of-sight antenna placement. If you use a point-to-point directional antenna, a maximum of 1/2 mile is supported. For our standard omni-directional antennas, we recommend a maximum of 150 feet per hop.
- Avoid any partial line-of-sight paths between antennas.
- Be cautious of trees or other foliage that may be near the path, or ones that may grow to obstruct the path.
- Be sure there is enough clearance from buildings and that no building construction may eventually block the path.
- Check the topology of the land between the antennas using topographical maps, aerial photos, or even satellite image data (software packages are available that may include this information for your area).
- Avoid a path that may incur temporary blockage due to the movement of cars, trains, or aircraft.

Installing the Meru Networks Enterprise Mesh

Enterprise Mesh APs are configured in three phases. Phase 1 consists of setting up a wired physical installation with APs connected to the controller through an Ethernet switch. In Phase 2 the AP are configured with their wireless mesh parameters. In Phase 3 the APs are disconnected from the Ethernet switch and placed in their final destination.

- **Phase 1: Connect Controller and APs with an Ethernet Switch**
- **Phase 2: Configure the APs for Enterprise Mesh**
  Check the Configuration Before Phase 3
- **Phase 3: Remove the Cables and Deploy the APs**

 © 2012 Meru Networks, Inc.

Phase 1: Connect Controller and APs with an Ethernet Switch

1. Connect all APs directly to a controller through a switch or hub.
2. Power on the controller.
3. Connect the APs to a power source using either separate power supplies or Power over Ethernet (PoE) connections.
4. If the controller does not have an assigned IP address, configure with the following, otherwise, skip to step 5:
   a. Connect a computer to the controller using a serial cable.
   b. Using a PC terminal program with the settings 115200 baud, 8 bit, no parity, access the controller and log in with the default admin/admin username/password.
   c. Use the **setup** command to assign the controller an IP address.
   d. Reboot the controller and log in again as **admin**.
5. For the APs that will be in the Enterprise mesh, verify they are connected to the controller (enabled and online) and ensure that APs' runtime version is the same version of System Director as the controller:
   — Check the System Director version with the command **show controller**
   — Verify the APs and with the command **show ap**
6. Check that you have installed an Enterprise Mesh license for all APs using the command **show license**.
   The output should show the WIRELESS entry:

```
Feature Name      CtlrStatus  LicenseType Expiry Date  TotalCount InUse

controller         active     permanent   -            1          1
ap                  active      permanent    -             200          5
WIRELESS_AP        active     permanent   -            10         0
        License Table(3)
```

Phase 2: Configure the APs for Enterprise Mesh

Phase 2 consists of configuring the mesh parameters of the APs while they are wired. Be sure that the APs are connected as described in Phase 1 and are online.

It is recommended that you attach a paper tag to each AP with its AP ID. Leave space to add the parent AP ID.

- This example uses a chain configuration, as shown in **Figure 37**. The chain configuration uses multiple hops within the **wireless** mode (which a hub and spoke configuration does not). In this example, the Enterprise Mesh consists of one gateway AP150, two wireless AP150s, and one wireless leaf AP150. The first wireless AP connects to the gateway AP, the second wireless AP connects to the first wireless AP, and the third wireless AP connects to the second wireless AP.
- If you are configuring a hub and spoke configuration, you will have a gateway (AP1) and leaf nodes configured as **wireless** that point to the gateway.

© 2012 Meru Networks, Inc.

To configure the Enterprise Mesh setup, you will configure one AP at a time (*in order*), moving from the gateway out toward to leaf.

Define the Channel of Operation for the Backhaul Link

The backhaul channel configuration on the 802.11a radio is configured on the gateway AP and replicated to the remaining wireless Enterprise Mesh APs when they are added to the mesh network via the parent AP configuration.

By default, channel 40 is set and need not be changed unless this channels is not available for your site.

To change the backhaul channel, on the gateway AP, enter the following commands. The **interface Dot11Radio** command specifies the AP ID (1 in this example) followed by the interface number (2). This example sets a backhaul to channel to 44.

```
Default# configure terminal
(config)# interface Dot11Radio 1 2
(config-if-802)# channel 44
(config-if-802)# end
```

After the channel is set, the AP reboots and appears on the newly configured channel. Use the command **show interfaces Dot11Radio 2** to verify the new backhaul channel for the AP.

Define the AP Role, Parent AP ID, and Backhaul Dataplane-Encryption

The Enterprise Mesh requires the AP roles change from the default **access** to **gateway** (for the one gateway AP) and **wireless** for the remaining APs**.** Configure the APs one at a time, in order, starting with the gateway. Turning on encryption results a secure environment.

1. For the AP that will be the gateway (this example uses AP 1), display the current AP setting with the **show ap** command:

```
Default# show ap 1

AP Table

AP ID                     : 1
AP Name                   : EMesh-GW
Serial Number             : 00:12:F2:04:02:b9
Uptime                    : 00d:00h:00m:00s
Location                  :
Building                  :
Floor                     :
Contact                   :
Operational State         : Enabled
Availability Status       : Online
Alarm State               :
LED Mode                  : Normal
AP Init Script            :
Boot Image Version        :
FPGA Version              :
Runtime Image Version     : 3.6-40
```

 © 2012 Meru Networks, Inc.

```
Connectivity Layer          : L2
Dataplane Encryption        : off
AP Role                     : access
Parent MAC Address          : 00:00:00:00:00:00
Parent AP ID                : 0
Link Probing Duration       : 120
AP Model                    : OAP180
AP Label                    : ATS5
Sensor AP ID                : 0
Hardware Revision           :
Power Supply Type           : 802.3-af
AP Indoor/Outdoor type      : Indoor
```

Note the output values for the AP Role, Parent AP ID, and Dataplane Encryption parameters. Initially all new APs have the default values shown above.

2. Change the AP Role to a **gateway** and enable encryption for security, then reboot the AP:

```
Default(config)# ap 1
Default(config-ap)# role gateway
Default(config-ap)# dataplane-encryption on
Default(config-ap)# end
Default)# reload ap 1
```

(Note that Parent AP configuration is not required for a gateway.)

3. Configure the wireless AP that will become AP 2 and that will consider the gateway its parent, then reboot the AP:

```
Default(config)# ap 2
Default(config-ap)# role wireless
Default(config-ap)# parent-ap 1
Default(config-ap)# dataplane-encryption on
Default(config-ap)# end
Default)# reload ap 2
```

The role **wireless** is used for all Enterprise Mesh APs that are not a gateway AP. The parent-ap ID identifies the parent AP for connection, AP 1 (the gateway) in this example.

4. Configure the third AP, which refers to AP 2 as its parent, as follows:

```
Default# configure terminal
Default(config)# ap 3
Default(config-ap)# role wireless
Default(config-ap)# parent-ap 2
Default(config-ap)# dataplane-encryption on
Default(config-ap)# end
Default)# reload ap 3
```

5. Configure the last AP, the leaf, as follows:

```
Default# configure terminal
Default(config)# ap 4
Default (config)# role wireless
```

© 2012 Meru Networks, Inc.

```
Default(config-ap)# parent-ap 3
Default(config-ap)# dataplane-encryption on
Default(config-ap)# end
Default)# reload ap 4
```

You can also configure these Enterprise Mesh parameters from the Web UI interface.

Check the Configuration Before Phase 3

Provisioning the wrong AP parameters can make the mesh backbone unable to reconnect. Also, it is difficult to debug a setup once the APs are in unreachable places. Therefore, boot up the system multiple times in the staging configuration (all connected to the wire in an installation room), until you are satisfied that the mesh consistently comes up correctly. Before removing the AP wires, confirm that the APs and the network are correctly configured by completing these tasks:

- **Make Sure the APs are on the Network**
  You see a list of configured APs online when you issue the command **show ap**. Note that each AP has two interface (IFIndex) entries, one for Ethernet and one for wireless.
- **Make Sure the Wireless APs Have Power**
  If an AP is getting power from a PoE and you disconnect the cable, you must provide another power source.
- **Check the AP Channels**
  Check the channels with the **show interfaces Dot11Radio** command. The results look something like this example:

```
1     AP-1 1 AP180 Up Enabled 11 on802.11 Normal
1     AP-1 2 AP180 Up Enabled 44 off 802.11 Normal
2     AP-2 1 AP150 Up Enabled 11 on802.11 Normal
2     AP-2 2 AP150 Up Enabled 44 off802.11 Normal
3     AP-3 1 AP150 Up Enabled 11 on 802.11 Normal
3     AP-3 2 AP150 Up Enabled 44 off802.11 Normal
4     AP-4 1 AP150 Up Enabled 11 on 802.11 Normal
4     AP-4 2 AP150 Up Enabled 44 off802.11 Normal
```

  Ensure that enabled APs (here AP-1, AP-2, AP-3 and AP-4) show the right channel (44) for their IfIndex 2. If only two of APs are showing and you configured more, you need to check your Enterprise Mesh licensing.
- **Check the Topology and Dataplane-Encryption for Each AP**
  Check the Enterprise Mesh-tree after the APs are configured with the command **show ap-topology**, which shows how the APs are connected to the controller:

```
Default#  show ap-topology

|_AP-1(wds 00:12:F2:00:ce:29 ch 44)
        |_|_AP-2 (wds 00:12:F2:00:cd:66 ch 44)
        |_|_|_AP-3 (wds 00:12:F2:00:ce:35 ch 44)
       |_|_|_|_AP-4 (wds 00:12:F2:00:cd:54 ch 44)
```

  An Enterprise Mesh interface (wds) shows the radio addresses of the next-hop forwarding and backhaul radio channel assignments.

 © 2012 Meru Networks, Inc.

Each Enterprise Mesh node has a forwarding address that contains the destination for the next hop, which provides the basic forwarding mechanism. As a packet moves towards the root of the Enterprise Mesh tree, the wds-table records the route that will be used when the packet is returned.

To ensure that the topology and dataplane-encryption in each AP is correct, issue the following command for each AP:

```
show ap 1
...
AP Role                  : gateway
Parent AP ID             : 0
Dataplane-Encryption : off
...
show ap 2
...
AP Role                  : wireless
Parent AP ID             : 1
Dataplane-Encryption : off
...
show ap 3
...
AP Role                  : wireless
Parent AP ID             : 2
Dataplane-Encryption : off
...
show ap 4
AP Role                  : wireless
Parent AP ID             : 3
Dataplane-Encryption : off
```

Determine from this output that:

- Each AP displays the correct role. In our example, AP1 has the gateway role, and the remaining three APs are wireless.
- Each wireless AP has two interface identifiers, the first is Ethernet and second is wireless.
- Each AP has its parent AP ID pointing to the correct AP. In our example, the gateway AP (AP-1) has no parent. The first wireless AP (AP-2) has the parent AP ID for the gateway (AP-1), and the second wireless AP (AP-3) has a parent AP ID of the first wireless AP (AP-2). The final AP has AP3 for a parent AP ID.

Phase 3: Remove the Cables and Deploy the APs

Phase 3 consists of removing the cables, deploying the APs in their final location, and turning them on. They will then be picked up by the controller as wireless APs.

To deploy the APs, follow these steps:

1. Determine that the first level of wireless APs are provisioned and connected, with parent APs showing the correct entries.
2. Ensure that each AP has a power source; if you are using PoE, you need to provide a power supply for wireless nodes or leaf nodes before Step 7.

© 2012 Meru Networks, Inc.

3. Unplug APs with power supplies.
4. Remove the Ethernet wires from the first level of wireless APs (in this example, AP-2).
5. Repeat steps 2 -3 for the second level (in this example, AP-3) of a connectivity tree and check that they connect to the intermediaries.
6. Repeat steps 2 -3 for the third level (in this example, AP-4) of a connectivity tree and check that they connect to the intermediaries.
7. Issue the CLI command **copy running-config startup-config** to save your setup.
8. Power up the APs in order starting with AP-1. Make sure an AP is online (light is green) before powering up the next one.
9. Check the status of the APs (**show ap #**). One should be operating as a **gateway** and the rest as **wireless**.
10. Create ESSIDs for clients and connect clients. Try pinging, browsing, etc. with the CLIents.
11. Power off and disconnect all APs with the role **wireless**. (Do not power off or disconnect the **gateway** AP.)
12. Relocate the APs to their operational location, and power them on in order starting with AP-1. Make sure an AP is online (light is green) before powering up the next one.

Provided the APs are in range with each other as per your topology design, they should appear online automatically with no further settings. Try them out as you did with the staging phase. Your installation is complete.

Enterprise Mesh Troubleshooting

Problem-Solution Chart

Problem	Possible Cause & Solution
During installation, I upgraded the wireless APs in the order as directed, but when I upgraded the controller (last), that wiped out all of the previous configurations.	Install the Enterprise Mesh license first, then perform the AP and controller upgrade.
Wireless APs are not connecting to their designated parent AP.	Ensure that AP150 Virtual Cell is not enabled. Ensure that bg-radio mode is not configured to **virtual** (AP150 virtual cell). Ensure that per-essid bridge is not enabled on wireless or gateway APs.

 © 2012 Meru Networks, Inc.

Problem	Possible Cause & Solution
Wireless APs were correct but are no longer pointing to their designated parent AP.	If, for any reason, an AP stops functioning, the rest of the downstream chain of wireless APs will lose connection. If this happens, restore the configured setup by first restoring the gateway AP to operation, then turning off the wireless APs. Turn the APs back on in order and operation.
Only two APs are showing up on the network but I configured more than two	Check your Enterprise Mesh licensing. Two APs are license-free, after the third, a license is needed.
APs are picking up a configuration that I did not create	Your APs may have inherited an old configuration from a previously-used AP. Try resetting all APs to factory defaults with the CLI command **reload ap** *id* **default** (for one AP) or **reload all default.** Then, follow the setup directions **Installing and Configuring an Enterprise Mesh System**.
APs are rebooting	A possibility could be bad channel conditions. Check the backhaul channel condition using a wireless sniffer.
No APs are online	Did you upgrade from 3.1.5? When upgrading from 3.1.5, you could lose your license key. **Workaround:** Reapply your license.

Troubleshooting via Console-over-Wireless

Console-over-Wireless (CoW) is a way of accessing a wireless AP for troubleshooting purposes. Considering that an AP may be deployed on rooftops, poles, or other inaccessible places, it can not be connected to a serial cable (RS-232). CoW enables access to the AP wirelessly with the help of a special client utility and the procedures described below.

There can be times when a AP is not able to connect to the controller and hence the Enterprise Mesh parameters need to be checked or configured on the AP itself. The Enterprise Mesh parameters are *channel*, *role*, and *parent-MAC*.

The following procedures may be used as a last resort to rescue an offline, physically unreachable all-wireless AP.

1. Ensure that you have the following:
   - Wireless adapters supported in the following http://www.winpcap.org/misc/faq.htm#Q-16
   - WinPcap 4.02 installed
   - wcoe.exe on the computer (downloaded from Meru Networks FTP with 3.5 release or later)
   - default windows wireless turned on the interface

© 2012 Meru Networks, Inc.

2. Associate with the ESSID. The ESSID is beaconing, but hidden (the hidden-bit is set in beacons) so do this:
   a. Open Network Connections (**Network Places -> View Network Connections**)
   b. Open **View the available networks** from the **Intel(R) PRo/Wireless** Connection.
   c. Change the order of preferred Networks from the left panel under **Related tasks**
   d. Click **Add a preferred network** and supply the parameters **SSID mcow-*aabbcc*** where *aabbcc* are the last 3 bytes of the AP's MAC address (which is the Serial Number in the **show ap** output).

Accessing Wireless AP via Console-over-Wireless Example

- Your Enterprise Mesh interface (wds1-31) is 00:12:F2:*aa*:*bb*:*cc*
- Your CoW ESSID is "mcow-*aabbcc*"
  - Network Authentication is Open
  - Data Encryption is WEP
  - Uncheck **The key is provided for me automatically**
  - Network key is mC0w!
  - Key Index is 3
  - Click **OK** twice
- Disable and enable your interface and based on order you connect to the ESS. Note that it shows "limited or no connectivity" because you don't get (or need) any IP address.

Note: This works only if the AP is in discovery loop or has not yet loaded any ESS profiles after booting up.

3. Connect to the AP with wcoe.exe as follows:
   - **wcoe -p -d 00:12:F2:c0:ec:0e** (you must use this command, as shown)
   - Select your Centrino interface
   - Pressing Enter gives you login prompt from the AP
   - To Escape out of the terminal program use Ctrl-Break
   - You can login as user **admin** with the default password **admin**
   - Use the command **wbsclient display flash**, which is the command to do the same as **wbs display flash** from serial console.

Note: wcoe is L2-based connectivity only, which does not use any IP addresses. If the node reboots in its discovery loop, as it occasionally does, you may be disconnected. Wait and reconnect after a short period of time.

4. Use the Enterprise Mesh CLI commands to display and configure Enterprise Mesh parameters:

 © 2012 Meru Networks, Inc.

```
# wbscli
   wbs mgr cli
   wbs { {display | show} {config | flash | table | help}
        | config { parent-mac <MAC>
                 | channel <number>
                 | country-code <number>
                 | encryption { on | off }
                 | role {wireless | gateway}
                 | help
                 }
   # wbscli display flash
   wbs mgr cli
   CliDisplay
   WBS parent-mac is ff:ff:ff:ff:ff:ff
   WBS channel is 40
   WBS country-code is 840
   WBS encryption is off
   WBS role is gateway.
   # wbscli config channel 44
   wbs mgr cli
   CliConfig
   channel : 44.
   # wbscli display flash
   wbs mgr cli
   CliDisplay
   WBS parent-mac is ff:ff:ff:ff:ff:ff
   WBS channel is 44
   WBS country-code is 840
   WBS encryption is off
   WBS role is gateway.
```

Use this procedure to configure other Enterprise Mesh parameters.

© 2012 Meru Networks, Inc.

© 2012 Meru Networks, Inc.

Chapter 17
Configuring SNMP

The SNMP Agent offers the network administrator performance management and fault management features, with the collection of statistics as well as notification of unusual events via traps.

This information applies to all controller models and the following APs:

- AP400
- AP300 / AP300i
- AP1000
- AP150 / OAP180

The Meru Wireless LAN System SNMP Agent can interoperate with 3rd party Network Management Systems (NMS) such as HP OpenView, and present alarm and trap information to configured management stations.

MERU Software Director supports versions of SNMP protocols. On MERU software, all versions (SNMPv1, SNMPv2c, and SNMPv3) of the Internet-Standard Management Framework share the same basic structure and components. Furthermore, all versions of the specifications of the Internet-Standard Management Framework follow the same architecture.

No	Feature	RFCs
1	SNMPv1	RFC-1155, RFC-1157
2	SNMPv2c	RFC-1901, RFC-1905, RFC-1906
3	SNMPv3	RFC-1905, RFC-1906, RFC-2571, RFC-2574, RFC-2575
4	MIB-II	RFC-1213
5	MERU Private MIB	MERU Wireless LAN Proprietary MIB

Note that Meru System Director doesn't support write operation through SNMP. You need to provision any required configuration through the CLI or Web UI.

© 2012 Meru Networks, Inc.

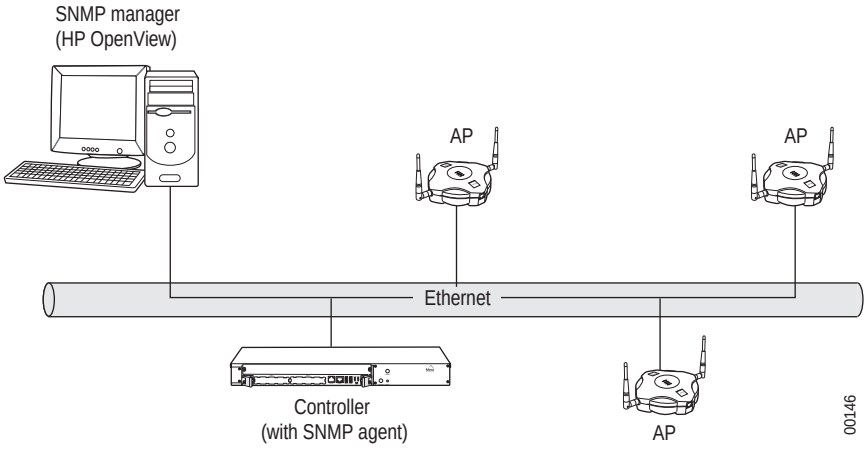
Features

The following protocols are supported for the read function only (not write):

- RFC-1214
- SNMPv1/v2c
- Meru WLAN systems

SNMP Architecture

Figure 38: SNMP Network Management Architecture



The Meru Wireless LAN System SNMP network management architecture follows the client-server architecture as illustrated in the diagram. The SNMP model of a managed network consists of the following elements:

- One or more managed nodes. In the illustration, the controller is among the managed nodes in the SNMP-based managed network. The SNMP agent is resident in the managed node. It collects statistics from the access points and combines them before sending them to the SNMP manager via MIB variables. Configuration information set via SNMP is also propagated to the access points by the SNMP agent.
- At least one management station containing management applications.
- Management information in each managed node, that describes the configuration, state, statistics, and that controls the actions of the managed node.
- A management protocol, which the managers and agents use to exchange management messages. In an SNMP managed network, the management protocol is SNMP (Simple Network Management Protocol). This defines the format and

 © 2012 Meru Networks, Inc.

meaning of the messages communicated between the managers and agents. Meru Meru Wireless LAN System provides support for traps, gets, and MIB walk functions only.

Neither read nor write privilege gives the SNMP manager access to the community strings. The controller can have an unlimited number of read and read/write community strings.

MIB Tables

The MIB tables supported by the Meru Meru Wireless LAN System SNMP implementation can be downloaded from the controller and then copied to an off-box location. The MIB Tables are also available on the Meru web site. A summary of the Meru Wireless LAN System MIB Enterprise tables are:

- mwstatistics.1
- mwGlobalStatistics.1 *
- mwIf80211StatsTable.1
- mwGlobalStatistics.2 *
- mwIfStatsTable.1
- mwIfStatsEntry.1
- mwGlobalStatistics.6 *
- mwStationStatsTable.1
- mwStationStatsEntry.1
- mwGlobalStatistics.7 *
- mwApStationStatsTable.1
- mwApStationStatsEntry.1
- mwGlobalStatistics.8 *
- mwCacApStatsTable.1
- mwCacApStatsEntry.1
- mwGlobalStatistics.9 *
- mwCacBssStatsTable.1
- mwCacBssStatsEntry.1
- mwStatistics.2 *
- mwTop10Statistics.1
- mwTop10ApStationProblemTable.1
- mwTop10ApStationProblemEntry.1
- mwTop10Statistics.2
- mwTop10ApStationRxtxTable.1

Global statistics use 64 bit counters in System Director 4.0 and later

© 2012 Meru Networks, Inc.

Download the MIB Tables for Management Applications

If you are using a third-party SNMP-based Network Manager program, you will need to integrate the Meru Meru Wireless LAN System proprietary MIB tables that allow the manager program to manage controllers and APs. The MIB tables are available in a compressed (zipped) file that can be copied from the controller to an off-box location.

To download the enterprise MIB Tables, contained in the file mibs.tar.gz, located in the images directory, use the following CLI commands:

```
controller# cd image
controller# copy mibs.tar.gz off-box_location
```

To download the enterprise MIB Tables using the Web UI, follow these steps:

1. Open a Web Browser(IE or Firefox), enter the system IP address (example: https://172.29.0.133) and then enter a user name and password (factory default user name/password is admin/admin).
2. Click **Configuration > SNMP > Setup > Download MIB Files > Download MIBs**.
   When the download is done, you will see the file listed in the Downloads list.
3. Save the file mibs(x).tar.gz.

SNMP Configuration

The SNMP agent in the controller must be properly configured for the following:

1. The read and write community strings must be configured before the Web UI can be used to view and update any of the components of the controller.
2. The trap manager must be configured so that traps are sent to the correct SNMP manager.
3. The contact and location information should also be correctly configured so that the SNMP manager can access this information and know who to contact in case of problems.

SNMP Community Strings

SNMP community strings authenticate access to MIB objects. They determine whether the SNMP manager has read and/or write access to particular MIB objects, if at all. Before the SNMP manager can access a controller, it must supply a community string that matches at least one of the community string definitions of the controller, with the same access privileges.

A community string can have one of these attributes:

 © 2012 Meru Networks, Inc.

- Read-only. Management stations with the community string can view all objects in the MIB, but cannot modify them.
- Read-write. This gives read and write access to authorized management stations to all objects in the MIB.

To configure community strings, enter privileged EXEC mode, and follow these steps:

Table 21: Configuring SNMP Community Strings

Command	Purpose
configure terminal	Enter global configuration mode.
snmp-server community *string host* {**ro**|**rw**}	Creates a new SNMP community string with the specified host and privileges. The host can either be a host name or an IP address in the format 255.255.255.255. The access privileges can be either read-only (**ro**) or read-write (**rw**).
end	Return to privileged EXEC mode
show running-config	Verify your entries.
copy running-config startup-config	(Optional) Save your entries in the configuration file.

Trap Managers

A trap manager is a management station that receives and processes traps. The controller can have an unlimited number of trap managers. Trap managers are grouped into communities. A single community may have one or more hosts, which are specified as IP addresses.

© 2012 Meru Networks, Inc.

Table 22: Configure SNMP Trap Managers

Command	Purpose
configure terminal	Enter global configuration mode.
snmp-server trap *community-string hostIP*	Specify the recipient of the trap message: • For *community-string*, specify the string to send with the notification operation. • For *hostIP*, specify the name or address of the host (the targeted recipient).
end	Return to privileged EXEC mode.
show running-config	Verify your entries.
copy running-config startup-config	(Optional) Save your entries in the configuration file.

 © 2012 Meru Networks, Inc.

SNMP Traps

These are important traps for the Meru Meru Wireless LAN System:

No	Case	Trap ID	Scenario
1	Controller Down	SNMP Poll	When a controller goes down or loses IP connectivity, SNMP Manager detects that the controller is down with an SNMP polling mechanism.
2	Controller Up	Cold Start trap	When a controller comes up, the SNMP Agent generates a <Cold Start> trap on the SNMP server.
3	NPlus1 Master Down	mwlMasterDown in meru-wlanmib. my	When a master controller with NPlus1 goes down, SNMP generates a MasterDown trap.
4	NPlus1 Master Up	mwlMasterUp in meru-wlan-mib. my	When a master controller with NPlus1 comes up, SNMP generates a MasterUp trap.
5	AP Down	mwlAtsDown in meru-wlan-mib. my	When an AP goes down, SNMP generates an AP_DOWN trap.
6	AP Up	mwlAtsUp in meru-wlanmib. my	When an AP comes up, SNMP generates an AP_UP trap.
7	Rogue AP detected	mwlRogueApDetected in meru-wlanmib.my	When the system detects a rogue device, SNMP generates a <RogueAPDetected> trap.
8	Rogue AP Removed	mwlRogueApRemoved in meru-wlanmib.my	When the system detects a rogue device has disappeared from the network, SNMP generates a <RogueAPRe-moved> trap.

The following chart lists all traps that exist for the Meru Meru Wireless LAN System:

© 2012 Meru Networks, Inc.

• mwlRogueApDetected • mwlRogueApRemoved • mwlAtsDown • mwlAtsUp • mwlWatchdogFailure • mwlWatchdogUp • mwlCertificateError • mwlCertificateInstalled • mwlApSoftwareVersionMismatch • mwlApSoftwareVersionMatch • mwlApInitFailure • mwlApInitFailureCleared • mwlApRadioCardFailure • mwlApRadioCardFailureCleared • mwlAuthFailure • mwlRadiusServerSwitchover • mwlRadiusServerSwitchoverFailure • mwlRadiusServerRestored • mwlAcctRadiusServerSwitchover • mwlAcctRadiusServerSwitchoverFailure • mwlMicFailure • mwlMicCounterMeasureActivated • mwlHardwareDiagnostic • mwlHardwareDiagnosticCleared • mwlCacLimitReached • mwlRadarDetected • mwlOperationalChannelChange	**New in version 3.6:** • mwlCacLimitReached • mwlRadarDetected • mwlMasterDown • mwlMasterUp • mwlSoftwareLicenseExpired • mwlSoftwareLicenseInstalled • mwlTopoStaAtsAdd • mwlAtsNeighborLoss • mwlAtsNeighborLossCleared • mwlHandoffFail • mwlHandoffFailCleared • mwlResourceThresholdExceed • mwlResourceThresholdExceedCleared • mwlSystemFailure • mwlSystemFailureCleared • mwlApBootimageVersionMismatch • mwlApBootimageVersionMatch • mwlMacFilterDeny • mwlMacFilterDenyCleared • mwlApTemperature • mwlApTemperatureCleared

 © 2012 Meru Networks, Inc.

Objects That Monitor System Status Through SNMP/OID

Use the SNMP get operation to monitor these objects:

No	Case	OID	Shows
1	System Uptime	mwWncVarsUpTime in mwConfigController.my	system uptime
2	System Operational Status	mwWncVarsOperationalState in mwConfigController.my	system's current operational status
3	System Availability Status	mwWncVarsAvailabilityStatus in mwConfigController.my	system's current available status.
4	AP Uptime	mwApUpTime in mwConfigAp.my	AP's uptime
5	AP Operational Status	mwApOperationalState in mwConfigAp.my	AP's current operational status
6	AP Availability Status	mwApAvailabilityStatus in mwConfigAp.my	AP's current available status

Agent Contact and Location Commands

The following are the commands to set the system description, contact and location of the SNMP agent:

Table 23: Configure SNMP Description, Contact and Location

Command	Purpose
`configure terminal`	Enter global configuration mode.
`snmp-server contact` *`text`*	Sets the system contact string. For example: **`snmp-server contact support@merunetworks.com`**
`snmp-server location` *`text`*	Sets the system location string. For example: **`snmp-server location Tower Building, IT Department`**

© 2012 Meru Networks, Inc.

Table 23: Configure SNMP Description, Contact and Location

Command	Purpose
snmp-server description *text*	Sets the system description string. For example: **snmp-server description main controller**
end	Return to privileged EXEC mode
show running-config	Verify your entries.
copy running-config startup-config	(Optional) Save your entries in the configuration file.

Configure SNMP Service on a Meru Controller With the CLI

Set up the SNMP server community with a specific IP address with these commands:

```
default# configure terminal
default(config)#
default(config)# snmp-server community public 0.0.0.0 rw
default(config)# end
default# show snmp-community
   SNMP Community Client IP Privilege
   public 0.0.0.0 read-write
   SNMP Community Management(1 entry)
default#
```

Set up the trap community with a specific IP address with these commands:

```
default# configure terminal
default(config)# snmp-server trap public 10.0.220.30
default(config)# end
default# show snmp-trap
   Trap Community Destination IP
   public 10.0.220.30
   SNMP Trap Management(1 entry)
```

Configure SNMP Service on a Meru Controller With the Web UI

Set up the SNMP server community with a specific IP address by following these steps:

1. Open a Web Browser(IE or Firefox), enter the system IP address (example: https://172.29.0.133) and then enter a user name and password (factory default user name/password is admin/admin).
2. Click **Configuration > SNMP > Setup > SNMP Community Management > Add.**

 © 2012 Meru Networks, Inc.

3. Provide an SNMP Community Name, Client IP Address, and select a privilege level such as **read-write**.
4. Click **OK**.

Set up the trap community with a specific IP address with these commands:

5. Click **Configuration > SNMP > Setup > SNMP Trap Management > Add**.
6. Provide a Trap Community and Trap Destination IP Address.
7. Click **OK**.

Set up 3rd Party Vendors

Meru MIB files should be compiled and loaded on SNMP manager to be used with Meru controller. SNMP Manager has to have Meru MIB file and compile to access Meru OIDs through SNMP. To download the Meru MIB file from the controller, follow these steps:

1. Open an MIB Compiler. Load and compile all MIBs.
2. Access the Meru controller from the Web UI.
3. From the MIB tree browser expand **ios -> org -> dod -> internet -> private -> enterprise -> meru -> meru-wlan -> mwConfiguration -> mwWncVars>.**
4. Activate a **walk** operation. This will query all OIDs under mwWncVars tree.

Enabling, Disabling, and Reloading SNMP

Once an SNMP configuration is complete, enable it with the command **snmp start**:

```
controller# snmp start
```

To turn off SNMP messaging, use the command **snmp stop**:

```
controller# snmp stop
```

To reload the SNMP module, use the command **reload-snmp**:

```
controller# reload-snmp
```

SNMP Version 3 Support

The SNMPv3 architecture, supported by System Director 4.0 and later, incorporates new descriptions for SNMP Entities (Managers, Agents, Proxy Forwarders), updated message formats, and standard MIBs used to configure access to entities. The SNMP Agent on Meru Network Controllers is multi-lingual with simultaneous support for SNMPv1/v2c/v3 if configurations such as snmp-community for SNMPv1/v2c or SNMPv3-user for SNMPv3 are correct. New features include:

© 2012 Meru Networks, Inc.

- Security levels for user authentication using entity shared secret keys
- Message time stamps
- Data secrecy using encryption
- Control of user access to MIB information based on the need to know

Security Levels

SNMPv3 provides both security levels and security models. A security level is the permitted level of security within a security model. A combination of a security level and a security model determine which security mechanism is employed when handling an SNMP packet. (See **Combinations of Security Levels and Security Models** in this document.) SNMPv3 messages can be sent at any of the following three security levels:

- **No Authentication and No Encryption** This is also called noAuth/noPriv. Priv refers to privacy. With this security, only a valid user name is required to access data or to send a trap.
- **Authentication and No Encryption** This is also called Auth/noPriv. With this security, you must be authenticated as a valid user for a message to be accepted. Authentication is accomplished by sharing a secret key and using that key to produce a message-hashed authentication code sent with each message.
- **Authentication and Encryption** This is also called Auth/Priv. With this security, you are authenticated and the data payload is encrypted using a second shared secret key.

Security Models

SNMPv3 provides for both security levels and security models. A security model is an authentication strategy that is set up the group in which a user resides. Three security models are now available:

- SNMPv1
- SNMPv2c
- SNMPv3

A combination of a security model and a security level will determine which security mechanism is employed when handling an SNMP packet. See **Combinations of Security Levels and Security Models** in this document.

Combinations of Security Levels and Security Models

The table below identifies the combinations of security models and levels and describes how security is handled with each combination.

 © 2012 Meru Networks, Inc.

Model	Level	Authentication	Encryption	What Happens
v1	noAuthNoPriv	Community String	No	Uses a community string match for authentication
v2c	noAuthNoPriv	Community String	No	Uses a community string match for authentication
v3	noAuthNoPriv	Username	No	Uses a username match for authentication
v3	authNoPriv	MD5 or SHA	No	Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms
v3	authPriv	MD5 or SHA	DES	Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms. Provides DES 56-bit encryption in addition to authentication based on the CBC-DES (DES-56) standard

SNMP Version 3 Commands

The *Meru System Director Command Reference* has detailed descriptions of these commands.

- snmpv3-user
- snmpv3-user auth-key
- snmpv3-user auth-protocol
- snmpv3-user priv-key
- snmpv3-user priv-protocol
- snmpv3-user target ip-address

SNMP Version 3 Support Limitations

Currently, Meru does not support the following SNMPv3 features.

- Since Meru Network Controllers do not support write access for SNMP MIBS, all users belong to the Read View Access Control table and they are handled as Read View with a group internally. View the Access Control Model (VACM) to determine if a user belonging to a specific group has access (Read, Write, Notify) to the management entity. Access Policy is defined by associating the respective read, write or notify view with a group.

© 2012 Meru Networks, Inc.

- SNMPv3 Notifications: Meru does not support SNMPv3 trap/inform. Along with the supported SNMPv3 feature (read only), Meru Network controllers still provide both SNMPv1/v2c accessibility using the existing snmp-community table and SNMPv1 trap using snmp-trap community table.

Chapter 18
Troubleshooting

- Where Do I Start?
- Error Messages
- System Logs
- System Diagnostics
- Capturing Packets
- FTP Error Codes

Where Do I Start?

We recommend that you start troubleshooting as follows:

Web UI or CLI?	Problem Involves?	Strategy
Web UI	stations	View station log history by clicking **Monitor > Diagnostics > Station**
Web UI	radios	View radio log history by clicking **Monitor > Diagnostics > Radio**
CLI	stations	View station-log history with one of these commands: **station-log show-mac=**<affected MAC address> **station-log show** (if the MAC is not known) If the problem is reproducible/occurring continually, log your terminal session, enter the station-log interface and add the affected MAC address using the command **station add <***MAC***>**. If you DON'T know the MAC address, enter **event all all** to capture all events for all MAC addresses.

© 2012 Meru Networks, Inc.

Web UI or CLI?	Problem Involves?	Strategy
CLI	controller	View controller-log history with the command **diagnostics-controller** If the problem is reproducible/occurring continually, log your terminal session, enter the station-log interface with the command **station-log**, and add the affected MAC address using the command **station add <***MAC***>**. If you DON'T know the MAC address, type **event all all** to capture all events for all MAC addresses.
3.6 CLI	stations or controller	View controller-log history with the command **diagnostics-controller** If the problem is reproducible/occurring continually, log your terminal session, enter the station-log interface and add the affected MAC address using the command **station add <***MAC***>**. If you DON'T know the MAC address, type **event all all** to capture all events for all MAC addresses.

3.6 Web UI	stations or controller	The command snort enables wireless sniffing from multiple APs simultaneously. You will need a WireShark client to retrieve captured output. It is best to configure snort from the GUI as it allows multiple AP selection per sniff. If you want to use the CLI, type the following from the CLI prompt:
		`configure terminal`
		`snort ip-address <IP of WireShark laptop>`
		`snort port 9177`
		`snort integration enabled`
		The command **snort integration enabled** is what turns on the sniff at each AP selected. Make sure that you always type **snort integration disabled** to disable the sniff after data gathering is complete.

 © 2012 Meru Networks, Inc.

Error Messages

The following are common error messages that may occur either at the controller or at an AP.

Message Text	Explanation
[07/20 13:02:11.122] 1m[35m**Warning**[0m WMAC: Wif(0):SetTsf() TSF[00000000:000006e3] -> [00000033:77491cfd]thr[00000000:03938700]	May be observed on the AP command line or in trace log output from an AP after a full diagnostics gather. The SetTsf() messages indicate that the AP has adjusted its TSF (TSF stands for Time Synchronization Function and is really the AP's clock) forward by more than a certain threshold (the threshold is 5 seconds). The specific case above indicates that the AP has just booted up and adjusted its TSF value to its neighboring AP's TSF value. You can tell that the AP just booted because its current TSF is a low value (i.e. 6e3 microseconds). During initialization, the AP will synchronize its TSF to the TSF of its neighbors whenever the neighbors support a BSSID in common with this AP. That is a requirement to support Virtual Cell.
[07/31 14:01:33.506] *****ERROR***** QOS: FlowMgr failed while processing flow request, reason= 5, srcMac[00:23:33:41:ed:27], dstMac[00:00:00:00:00:00].	May be observed in the controller's CLI interface. This error occurs when there is an attempt to either set up or remove an AP flow on a station that has started a phone call. "reason=5" means the cited station is not assigned to the AP where the attempt to set up/ remove the flow was made. The presumed impact is that the stations (presumably phones) get lower than normal call quality since there are no QoS flows established on behalf of the MAC address.
Received non-local pkt on AP!	This message may be observed on the serial console of a controller or in the dmesg.txt output included with a controller's diagnostics. This message indicates that a Ethernet type 0x4001 or UDP port 5000 packet (L2 and L3 COMM respectively) was received by the controller's Ethernet, but was not actually destined for the controller's MAC or IP address.

© 2012 Meru Networks, Inc.

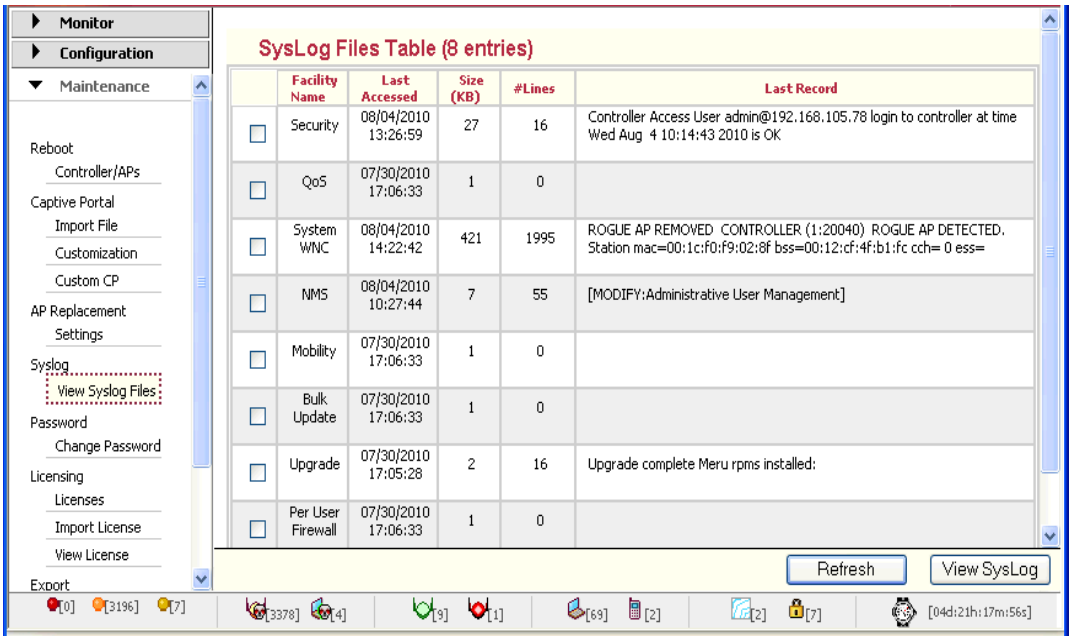
System Logs

The 5.1 system log records the following:

- Configuration changes (CLI or GUI)
- Key commands
- Events and operations
- Errors

The CLI command **show log** lists the entire log. To view the system log files from the Web UI, click **Maintenance > Syslog > View Syslog Files**.

Figure 39: Syslog Files Table



Facility Name can be one of these eight sources of information:

Facility	Messages contain...
Security	Creation and violation of security configuration, including User log-ins and Captive Portal activity
QoS	Quality of Service messages for both creation and violation of QoS rules created on this controller
System WNC	Rogue AP syslog messages

© 2012 Meru Networks, Inc.

Facility	Messages contain...
NMS	Network Manager Server syslog messages
Mobility	Handoff or redirect messages
Bulk Update	Any use of the bulk update commands available from the GUI are noted here. The Bulk Update function, accessed from the AP Configuration, Wireless Interfaces Configuration, and Antenna Property pages, updates a group of selected APs. Bulk Update works the same in each of these areas, but the items to be updated are specific to the page where the bulk update is being initiated.
Upgrade	Any use of the CLI command **upgrade**
Per-user Firewall	Creation and violation of per-user firewalls

Select one of the Facilities listed in the above chart and then click **View Syslog** to see these details:

Entry	Meaning
Line	Line number of the syslog file where the entry is located
Priority	Severity of the entry. Possible priorities are: debug, info, notice, warning, error, err, crit, alert, emerg, panic.
Mnemonic	Three-letter mnemonic assigned to the entry: CAP = Captive Portal RED = redirect FOR = forward WAU = WebAuth user authentication WST = Web Server Event WPW = Web UI user password administration
Time	Date and time when the entry was logged.
Record	The details of the syslog event depend on the category of the message: **Security**: User logins, Captive Portal activity **QoS**: Creation and violation of QoS rules **System WNC**: Rogue activity **NMS**: If this controller is part of Network Manager, all activity initiated by the Network Manager Server **Mobility**: This consists primarily of RED (redirect) messages **Bulk Update**: AP updates done in groups **Upgrade**: System Director upgrades **Per-User Firewall**: Creation and violation of firewalls

To search for information on any column of a Facility screen like the one in **Figure 40**, do the following. In the box at the top of any column (Line, Priority, Mnemonic, Time, Record), provide search data to filter the messages. You then see only messages that fit that filter. For **Priority**, you see messages of the selected priority level and higher; for example, a search for debug shows every message because debug is the lowest priority level. A search for info shows the messages info and higher: notice, warning, error, err, crit, alert emerg, panic (highest priority).

You can also click the calendar icon above the Time column to enter a specific date or time to filter syslog messages in this category.

 © 2012 Meru Networks, Inc.

Station Log Events

Station log event messages are displayed in this format:

```
[object name, field name <old value: new value>, field name <old value: new value> …]"
Log Category : "nms", Priority : 'info", Mnemonic : "CONFIG"
```

The following chart describes some common station log events.

Event	Condition That Triggers Event	Interpretation
| 00:0f:8f:9d:d3:23 | Station Assign | <AID=1> assigned to <AP_ID=31><ESSID=swhan-essid><BSSID=00:0c:e6:9d:4f:be>	A mobile station is assigned to AP::ESSID::BSSID.	A mobile station is assigned to the BSSID. Once a mobile station is assigned to AP::ESSID::BSSID, the mobile proceeds to the next stage, 802.11 authentication and association. The AID value is assigned to the station if it goes through 802.11 authentication/ association.
| 00:0f:8f:9d:d3:23 | Station Assign | <AID=1> Assign Removed From <AP_ID=31><ESSID=swhan-essid><BSSID=00:0c:e6:9d:4f:be>	A mobile station's assignment state is removed from AP::ESSID::BSSID.	A mobile station cannot proceed to the next stage, assignment. The most common cause is that a mobile station did not proceed to the 802.11 authentication or association stage within the Station Assignment Aging Time.
00:16:6f:3b:17:a9|IP Address Discovered| <Old IP discovery Method=none><Old IP=0.0.0.0<New IP discovery Method=dynamic><New IP=10.101.66.25>	A Mobile station's discovery method or IP address changes and the system accepts the new IP address.	The new IP field indicates an IP address being used by a station.

© 2012 Meru Networks, Inc.

Event	Condition That Triggers Event	Interpretation
00:16:6f:3b:17:a9|IP Address Discovered| <IP = 10.101.64.100> fails due to one of local IPs	A Mobile station is detected trying to use the controller's IP address.	The system blocks IP traffic from the station using the IP address.
00:16:6f:3b:17:a9|IP Address Discovered| ip update not performed. <Client IP=10.101.64.1> is used by a wired station <00:0e:84:85:33:00>	A Mobile station is detected trying to use the IP used by a wired station whose MAC address is shown.	The system blocks IP traffic from the station using the IP address.

Syslog Message	Description
AP DOWN CLEAR Access Point <ap-id> is up	Access Point *ap-id* was added to the WLAN. The coverage is extended. Action: None
AP DOWN CRITICAL Access Point <ap-id> is down	Access Point *ap-id* was removed from WLAN. Expect loss of service in some areas. Action: If this event is unexpected, check the network connectivity between the access point and the controller.
AP rebooted by admin	Access Point has been manually rebooted. Action: None
AP Software Version Mismatch	The software version on the AP does not match that on the Controller. This message can be generated because the auto-AP upgrade feature is disabled. Action: To resolve this condition, the AP must be upgraded manually with the **upgrade ap** command to ensure continued functionality.
CAP <user>@<a.b.c.d> logged in <OK|FAILED>	The specified Captive Portal user has logged in successfully (OK) or has been refused login (FAILED).

© 2012 Meru Networks, Inc.

Syslog Message	Description
Controller rebooted by admin	Controller has been manually rebooted.
AP Boot Image Version Mismatch	The boot image version on the AP does not match that required for the version of the AP software. Action: The boot image must be upgraded using the **upgrade ap** command with the boot image option before attempting to upgrade the AP software version.
AP Initialization Failure	The AP failed to initialize properly. Action: Check that the AP network cables are properly connected. Check that the version of the AP boot image matches the version of the AP software, and that the AP software version matches the software version of the controller. If the AP still fails to initialize after these checks, contact Meru Customer Support.
AP Temperature	The AP temperature has exceeded the maximum threshold.
Hardware Diagnostic	The AP failed the hardware diagnostic checks. Action: Contact Meru Customer Support.
ROGUE AP DETECTED CLEAR STATION mac=<mac-address> bss=<bssid> ch=<channel-id> reported by AP <ap-id>	A station previously reported as rogue is not detected any longer by any of the access points.
ROGUE AP DETECTED CRITICAL STATION mac=<mac-address> bss=<bssid> ch=<channel-id> reported by AP <ap-id>	A station using an unknown BSSID as been detected. Action: Check if the *bssid* belongs to another valid WLAN. If not, you may decide to turn on the rogue AP mitigation feature.
Radio Card Failure	The AP radio card has failed. Contact Meru Customer Support.
WLAN services started on controller	System Director processes have been started on the controller.

© 2012 Meru Networks, Inc.

Syslog Message	Description
WLAN services stopped on controller	System Director processes have been stopped.
WST:WS Serving...	Web server new event message.
WPW :<user>@<a.b.c.d> changed password <OK | FAILED>	The specified System Director user has either successfully changed their password (OK) or was unable to change the password (FAILED).

MAC Filtering Station Log Events

Seven events are defined for MAC Filtering log events.

Event	Condition That Triggers Event	Interpretation
| 00:66:77:c2:03:01 | Mac Filtering | Mac in permit list - accept client	A station, 00:66:77:c2:03:01, is in the ACL Allow Access List, and a Permit List Enabled is on.	A mobile station goes to the next stage or assignment.
| 00:66:77:c2:04:01 | Mac Filtering | Mac not in permit list - reject client	A station, 00:66:77:c2:04:01, is not in the ACL Allow Access List, and Permit List Enabled is on. Radius authentication is disabled.	A mobile station cannot proceed to the next stage or assignment.
| 00:66:77:c2:03:01 | Mac Filtering | Mac not in deny list - accept client	A station, 00:66:77:c2:03:01, is not in the ACL Deny Access List and Deny List Enabled is on. Radius authentication is disabled.	A mobile station goes to the next stage or assignment.
| 00:66:77:c2:04:01 | Mac Filtering | Mac in deny list - reject client	The station 00:66:77:c2:04:01 is in the ACL Deny Access List and Deny List Enabled is on. Radius authentication is disabled.	A mobile station can't proceed to the next stage or assignment.
| 00:66:77:c2:03:01 | Mac Filtering | Sent Radius request	Radius authentication is enabled and a Radius authentication request message is sent.	A Radius request message is sent for an authentication.

 © 2012 Meru Networks, Inc.

Event	Condition That Triggers Event	Interpretation
| 00:66:77:c2:02:01 | Mac Filtering | Radius authentication succeeded (vlan 0)	Radius authentication is enabled, and a Radius accept response message is received.	A mobile station goes to the next stage or assignment.
| 00:66:77:c2:02:06 | Mac Filtering | Radius authentication failed	Radius authentication is enabled, and a Radius reject response message is received.	A mobile station cannot proceed to the next stage or assignment.

Key Exchange Station Log Events

Key exchange is a security method in which cryptographic keys are exchanged between users. A station goes through this stage of connection when any of these are enabled: WPA, WPA2, WPA PSK, WPA2 PSK, MIXED or MIXED_PSK.

Event	Condition That Triggers Event	Interpretation
00:16:6f:3b:17:a9 |1X Authentication |M1 <msg type=EAPOL_KEY> PTK sent	The system sends a first key exchange message.	This is common for WPA, WPA2, WPA PSK, WPA2 PSK, MIXED or MIXED_PSK. The system tries transmission up to 4 times and then aborts the key exchange transaction if it doesn't receive an M2 message by sending 802.11 deauth.
M2 <pkt type=EAPOL_KEY> MIC Verified	The system receives a key exchange message, M2, from a station, and MIC is verified correctly.	This is common for WPA, WPA2, WPA PSK, WPA2 PSK, MIXED or MIXED_PSK.
00:16:6f:3b:17:a9 |1X Authentication | M3 <msg type=EAPOL_KEY> WPA PTK Negotiation sent	The system sends a third key exchange message for WPA or WPA-PSK modes.	The system tries transmission up to 4 times, and then aborts the key exchange transaction if it doesn't receive M2 message by sending 802.11 deauth.
00:16:6f:3b:17:a9 |1X Authentication | M4 <pkt type=EAPOL_KEY> <key type=Unicast Key> Key Pairwise	The system receives a fourth key exchange message from a station for WPA or WPA-PSK modes.	The system tries transmission up to 4 times, and then aborts the key exchange transaction if it doesn't receive M2 message by sending 802.11 deauth.

© 2012 Meru Networks, Inc.

Event	Condition That Triggers Event	Interpretation
00:16:6f:3b:17:a9 |1X Authentication | M5 <msg type=EAPOL_KEY> WPA GTK Rekey Negotiation sent	The system sends a fifth key exchange message for WPA or WPA-PSK modes.	
00:16:6f:3b:17:a9 |1X Authentication | M6 <pkt type=EAPOL_KEY> <key type=Group Key>	The system receives a sixth key exchange message from a station for WPA or WPA-PSK modes.	This is the last message of a key exchange for WPA or WPA-PSK. It indicates a successful key exchange. A station can proceed to the next stage.
00:16:6f:3b:17:a9 |1X Authentication | M3 <msg type=EAPOL_KEY> WPA2 PTK Negotiation sent	The system sends a third key exchange message for WPA2 or WPA2-PSK modes.	The system tries transmission up to 4 times and then aborts the key exchange transaction if it doesn't receive M2 message by sending 802.11 deauth.
00:16:6f:3b:17:a9 |1X Authentication | M4 <pkt type=EAPOL_KEY> <key type=Unicast Key> Key Pairwise	The system receives a fourth key exchange message from a station for WPA2 or WPA2-PSK modes.	This is a last message of a key exchange for WPA2 or WPA2-PSK. It indicates a successful key exchange. A station can proceed to a next stage.
00:16:6f:3b:17:a9 |1X Authentication |Sending Station Disconnect, Reason : MIC Failure, Auth Type 802.1X	The message sent by a station results in a MIC failure.	For WPA-PSK, or WPA2-PSK, the wrong passphrase or password leads to this failure. When the MIC failure occurs, a the system sends a 802.11 deauth to the station.
00:16:6f:3b:17:a9 |1X Authentication |Sending Station Disconnect, Reason : 4-way Handshake Timeout, Auth Type 802.1X	The key exchange aborts due to no response from a client.	The system tries to transmit a key exchange message up to 6 times with one second intervals. If the station does not respond, it aborts the key exchange.

Authentication Station Log Events

Event	Condition That Triggers Event	Interpretation
00:16:6f:3b:17:a9 |802.11 State |state change <old=Unauthenticated><new=Authenticated><AP=00:0c:e6:04:fc:ad><BSSID=00:0c:e6:0a:ca:6e>	A station successfully completes the 802.11 authentication phase on AP::BSSID.	
00:16:6f:3b:17:a9 |802.11 State |state change <old=Unauthenticated><new=Authenticated><AP=00:0c:e6:04:fc:ad><BSSID=00:0c:e6:0a:ca:6e>	A station successfully completes the 802.11 association phase on AP::BSSID.	

© 2012 Meru Networks, Inc.

Event	Condition That Triggers Event	Interpretation
00:16:6f:3b:17:a9 |802.11 State |state change <old=Associated><new=Unauthenticated><AP=00:0c:e6:04:fc:c0><BSSID=00:0c:e6:d8:84:14>	A station's 802.11 state changes from Associated to Unauthenticated.	A state change from associated to unauthenticated can happen because: • Station ages out. The default aging out period is 30 minutes. The aging out period of 802.11 associated stations is different from the aging out period of an assigned stations. • Station voluntarily leaves a currently associated BSSID by sending a 802.11 deauthentication frame. • Station moves from BSSIDOLD to BSSIDNEW. The associated state of BSSIDOLD is automatically cleared up. • In the multi-controller environment, a station moves from ControllerOLD to ControllerNEW and the two controllers are in the same subnet; the associated state of the station in ControllerOLD is automatically cleared up. • 1x/WPA/WPA2 authentication fails due to either Radius reject, a message timeout, or an unknown reason. • A key exchange fails due to timeout or MIC failure.

 © 2012 Meru Networks, Inc.

Event	Condition That Triggers Event	Interpretation
00:16:6f:3b:17:a9 |802.11 State |<AID=1> handoff <OLD_AP_ID=3><NEW_AP_ID=4><BSSID=00:0c:e6:30:47:17>	Station is handed off from an AP to another AP.	This event is generated only if a mobile station is associated to the ESS of a Virtual Cell or a Virtual Port. The abbreviations mean the following: **AID**: Association ID **OLD_AP_ID**: AP servicing the station before the handoff **NEW_AP_ID**: AP servicing the station after the handoff **BSSID**: Parent BSSID in the Virtual Cell or Virtual Port.
00:16:6f:3b:17:a9 |802.11 State |Received Deauth frame from station <Deauth reason: authentication leave><deauth packet RSSI = 62><AID=3><BSSID=00:0c:e6:f9:01:01>	Station sends 802.11 de-authentication frame.	Station decided to leave the ESS/BSS. This is only supported by AP300/AP400.
00:16:6f:3b:17:a9 |802.11 State | Received Disassoc frame from station <Disassoc reason: association leave><deauth packet RSSI = 57><AID=3><BSSID=00:0c:e6:f9:01:01>	Station sends 802.11 dis-association frame.	Station decided to disassociate. This is only supported by AP300/AP400.

1X/WPA/WPA2 Authentication Station Log Events

DHCP Station Log Events

Event	Condition That Triggers Event	Interpretation
`|00:16:6f:3b:17:a9 | 1X Authentication |<auth method=WPA2_EAP>:<pkt type=EAPOL_START> recvd <ESSID=vcellwpa2> <BSSID=22:01:0f:3b:17:a9>`	The system receives EAPOL_START message from a station associated to an ESSID::BSSID pair.	There are two auth methods; WAP2_EAP or WPA_EAP. The standard states that this message is optional.
`|00:16:6f:3b:17:a9 | 1X Authentication | <EAP code=request> <EAP ID=1> <EAP type=Identity> sent`	The system sends an EAP Identity Request to the station.	The system tries this message up to four times with one second intervals. As authentication proceeds, the EAP ID increases by one.
|00:16:6f:3b:17:a9 | 1X Authentication |<pkt type=EAP_PACKET> <EAP code=response><EAP ID=1>	The system receives an EAP Response message from a station.	The EAP ID of the response must match the EAP ID of request.
00:16:6f:3b:17:a9|1X Authentication| Radius <msg code=access_request><msg ID=178> sent <ip=192.168.101.17>:<port=1812>	The system forwards a station's request to the Radius Server IP::Port	As authentication proceeds, the message ID increases by one.
00:16:6f:3b:17:a9|1X Authentication| <pkt type=EAP_PACKET> <EAP code=request><EAP ID=2> <info=relay eap-request from Radius> sent	The system forward a Radius Server's request to a station.	
00:16:6f:3b:17:a9|1X Authentication| <pkt type=EAP_PACKET> <EAP code=success><EAP ID=13> <info=relay eap-request from Radius> sent	The system receives Radius Accept message, and send EAP SUCCESS message to a mobile.	This is the last message of an authentication. A key exchange stage immediately follows if WAP or WAP2 is used.
00:16:6f:3b:17:a9|1X Authentication| Backend Authentication Timeout	A message forwarded to a Radius server is timed out.	

 © 2012 Meru Networks, Inc.

Event	Condition That Triggers Event	Interpretation
00:16:6f:3b:17:a9|1X Authentication| Sending EAP Failure to station, (identifier 1)	An EAP failure message is sent to a station.	Three cases trigger this event: • A Radius message times out • An EAP message to a station times out • A Radius Server sends a reject message
00:16:6f:3b:17:a9|1X Authentication| Radius Access-Reject received	The system receives a Radius Reject message from a Radius server.	
00:16:6f:3b:17:a9|1X Authentication| Backend Authentication Failure	The system receives a Radius Reject message from a Radius server.	

Event	Condition That Triggers Event	Interpretation
00:16:6f:3b:17:a9|DHCP | <msg_type=DISCOVER><server_ip=255.255.255.255><server_mac=ff:ff:ff:ff:ff:ff><client_ip=0.0.0.0	The system receives a DHCP message from a station.	The message displays a server's IP and MAC, and a client's IP. DHCP message types displayed are DISCOVER, REQUEST, or RELEASE.
00:16:6f:3b:17:a9|DHCP |<msg_type=OFFER><server_ip=10.101.64.1><server_mac=00:0e:84:85:33:00><offered_ip=10.101.66.25>	The system receives a DHCP message from a DHCP server.	The message displays a server's IP and MAC, and a client's offered IP. DHCP message types displayed are OFFER, ACK, NACK or INFORM.

© 2012 Meru Networks, Inc.

Captive Portal Station Log Event

Event	Condition That Triggers Event	Interpretation
00:16:6f:3b:17:a9|CP User Authentication| <User=vijay> authenticated <ipaddr=10.101.66.25>	The system gets a Radius Accept message.	A user is authenticated successfully.

System Diagnostics

There are three sets of diagnostics for a controller:

- Radio diagnostics
- Station diagnostics
- Inferences

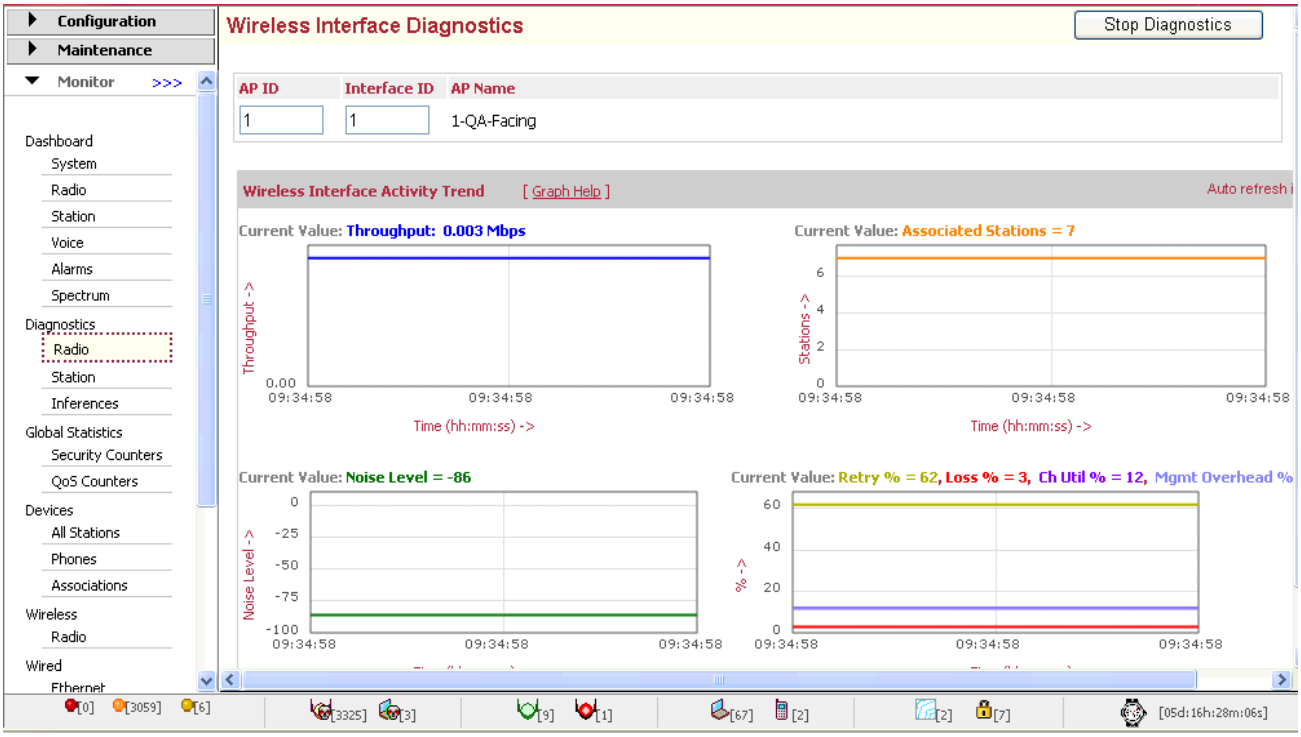
Radio diagnostics

Each AP has either one or two radios that can be configured individually (**Configuration > Wireless > Radio**). You can check on the wireless activity trends for these radios by looking at the diagnostic information:

1. Click **Monitor > Diagnostics > Radio**.
2. Provide an AP number and an interface ID (Radio 1 or 2).
3. Click **Start Diagnostics** in the upper right corner of the screen.

 © 2012 Meru Networks, Inc.

Figure 41: Radio Diagnostics



4. Check the four charts for these radio trends:

Chart	What it tells you	Why you might want to know this
Throughput	Sum of upstream and downstream traffic for the radio	Users are experiencing slow response in the area covered by this AP
Noise Level	How much unwanted energy is present in the received radio signals	Users are experiencing connection problems or low transmission speeds in the region covered by this AP

© 2012 Meru Networks, Inc.

Chart	What it tells you	Why you might want to know this
Associated Stations	How many clients are using this AP	Find out if you need to add another AP (consult your reseller for specific AP deployment recommendations)
Current Value	Packet retries, loss %, channel utilization, and management overhead for the radio	Users are experiencing slow response in the area covered by this AP

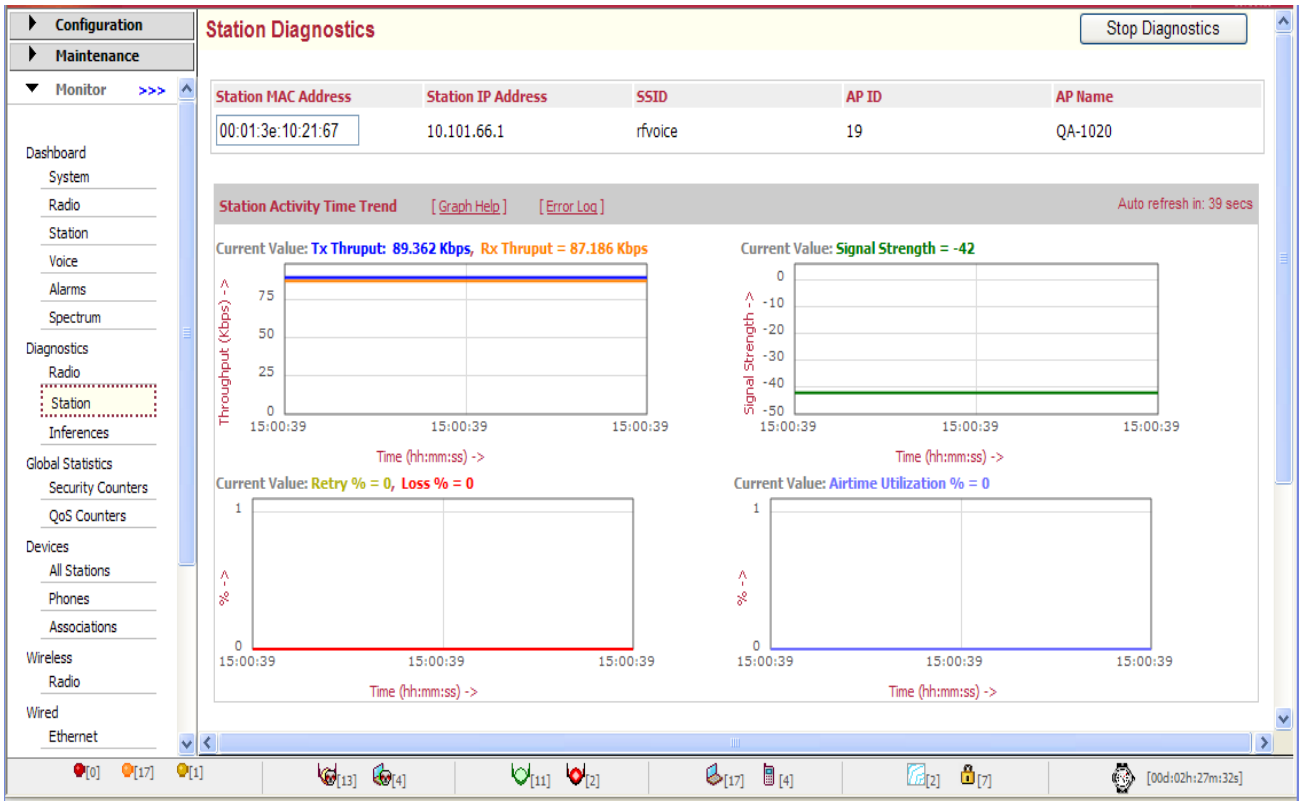
Station diagnostics

Each client on an AP can be studied individually by looking at the station diagnostic information:

1. Click **Monitor > Diagnostics > Station**.
2. Provide a MAC address for the client. One way to determine the client MAC address on Windows XP is to open the Command Prompt by clicking **Programs > Accessories > Command Prompt** and then entering the command **ipconfig /all** - this gives you physical addresses for the wireless connections.
3. Click **Start Diagnostics** in the upper right corner of the screen.

 © 2012 Meru Networks, Inc.

Figure 42: Station Diagnostics



4. Check the four charts for these station trends:
   - Throughput
   - Loss %
   - Signal Strength
   - Airtime Utilization
5. Click **Help** for explanations for the charts.

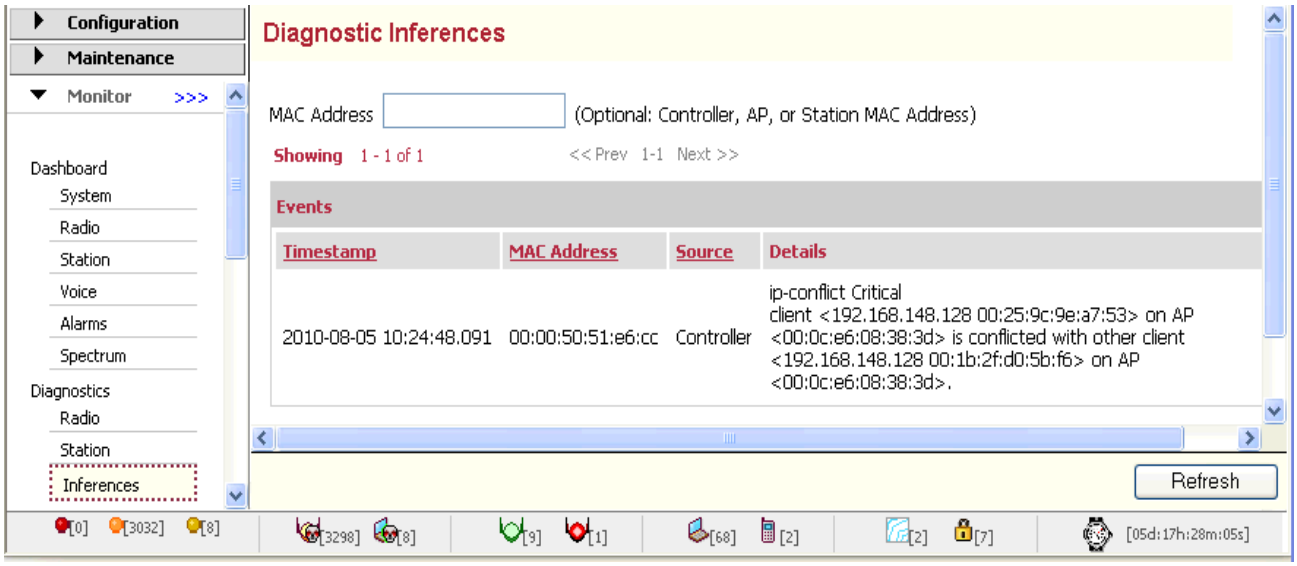
Inferences

Inferences are best guesses as to what could be wrong with your wireless network. Check a controller, AP, and station by looking at the diagnostic inferences:

1. Click **Monitor > Diagnostics > Inferences**.
2. Optionally narrow down the list by providing a MAC address for a controller, AP, or station.
   A list of recent events is listed along with corresponding details.

© 2012 Meru Networks, Inc.

Figure 43: Diagnostic Inferences



The first part of the message is the issue and level of severity. In the example above, there is an IP conflict which is a critical issue. The information in a Station Entry is listed below. You can read it or alternately cut and paste the MAC address into the Station Diagnostics window.

Figure 44: Decoding a Station Entry

Sample Station Entry

Inference Rule #8 matched : IP Address Update 32 times within 360 seconds.
[IP 172.27.0.198] [dhcp] [data] [AP-3 AP-3] [BSSID 00:0c:e6:3d:0b:45] [ESSID rcomm_diag]
[Vlan Tag 0] [L2 State clear] [L3 State clear] [First Seen @ UTC Jun 9 13:50:22]

Inference Rule #12 matched : Soft Handoff 21 times within 360 seconds.
[IP 172.27.0.198] [dhcp] [data] [AP-2 AP-2] [BSSID 00:0c:e6:3d:0b:45] [ESSID rcomm_diag]
[Vlan Tag 0] [L2 State clear] [L3 State clear] [First Seen @ UTC Jun 9 13:50:22]

Information Provided

- Rule that triggered entry
- Latest IP address of station
- DHCP used
- Type of traffic (data or SIP)
- AP updated
- BSSID of Station
- ESSID of Station
- VLAN tag number
- Authentication used on L2
- Authentication used on L3
- Date problem was first seen

© 2012 Meru Networks, Inc.

Station Inference Messages

Some possible station rules and messages are:

#	Station Message	Remarks
1	MAC Filter ACL Success	Station executed MAC filtering ACL authentication
2	MAC Filter ACL Failure	Station exceeded threshold of MAC filtering ACL authentication attempts
3	MAC Filter Radius Success	Station executed MAC filtering Radius authentication
4	MAC Filter Radius Failure	Station exceeded threshold of MAC filtering Radius authentication attempts
5	Assignment Failure	Station exceeded threshold of 802.11 assignment attempts. This could be caused by any of the following: • Associated AP is not found in AP table • Maximum number of stations, which varies with AP models, is exceeded • Maximum number of licensed stations is exceeded • Controller has not received configuration of the AP yet • BSSID for a client to be assigned is not found in the BSS table • AP does not have a free slot for the station • RSSI is not appropriate for the station
6	WEP-key Index Mismatch	Monitor WEP-key index mismatched count (Not implemented yet)
7	Association Success	Station executed 802.11 association
8	Key Exchange Success	Station executed 802.1x key exchange

© 2012 Meru Networks, Inc.

#	Station Message	Remarks
9	Key Exchange Failure	Station exceeded threshold of 802.1x key exchange attempts. An AP detected either of the following conditions of 1X authentication failure between the AP and the client; • EAPoL handshaking failed • EAPoL handshaking timed out Another possible cause is that Hostapd detected one of the following conditions of 1X authentication and 802.1x key exchange failure: • Invalid Radius VLAN tag detected • EAP packet failed to reach the station • MIC failure occurred and both the counts of MIC failure and 802.1x key exchange failure are increased • 4-way handshake timed out • Group key update timed out • EAP key replay counter is mismatched
10	MIC Failure	Station exceeded threshold of 802.1x MIC attempts
11	802.1x Radius Success	Station executed 802.1x Radius authentication
12	802.1x Radius Failure	Station exceeded threshold of 802.1x Radius authentication attempts
13	IP Address Update	IP address changed from valid to 0, 0 to valid, or valid to valid
14	Data Decryption Failure	Data decryption failure of RX packet occurred; attempt threshold was exceeded. Hostapd detected that Ess.MicCountermeasureData.MicCounter exceeded 1 within the MIC_COUNTERMEASURE_PERIOD (60 seconds). When this occurs, Hostapd notifies the AP to stop accepting communication from that station and disassociate the station.
15	CP Guest User Success	Station authenticated a Captive-Portal guest
16	CP Guest User Failure	Station exceeded threshold of Captive-Portal guest authentication attempts
17	CP Radius User Success	Station authenticated Captive-Portal user using Radius
18	CP Radius User Failure	Station exceeded threshold of Captive-Portal Radius user authentication attempts
19	Soft-Handoff	Station executed soft-handoff

Some possible controller inference messages are:

 © 2012 Meru Networks, Inc.

Controller Message	What it tells you
DHCP server reached	DHCP Server required for IP address assignment is reachable
DHCP server unreachable	DHCP Server required for IP address assignment is unreachable
Gateway reached	Default gateway for client sub-network is reachable
Gateway unreachable	Default gateway for client sub-network is unreachable
Radius server reached	Radius server required for client authentication is reachable
Radius server unreachable	Radius server required for client authentication is unreachable
VLAN gateway reached	VLAN gateway in the path for client communication is reachable
VLAN gateway unreachable	VLAN gateway in the path for client communication is unreachable
IP Address conflict between wireless clients or between wired and wireless clients or between wireless client and controller	At least two wireless clients or controllers have been assigned (or have specified) the same IP address, which is causing network confusion.
IP un-assignment of client by failure of DHCP IP assignment	An IP address has been removed from the client due to the DHCP server failing to provide an assignment.

Diagnostic Inferences Using the CLI

To see Controller Diagnostic Inferences with the CLI, turn on controller diagnostic inferences with the diag-log command **admin controller on.**

```
Meru01# configure terminal
Meru01(config)# diag-log
Meru01(config-diag-log)# admin controller on
```

Turn on station diagnostic inferences with the diag-log command **admin station on**.

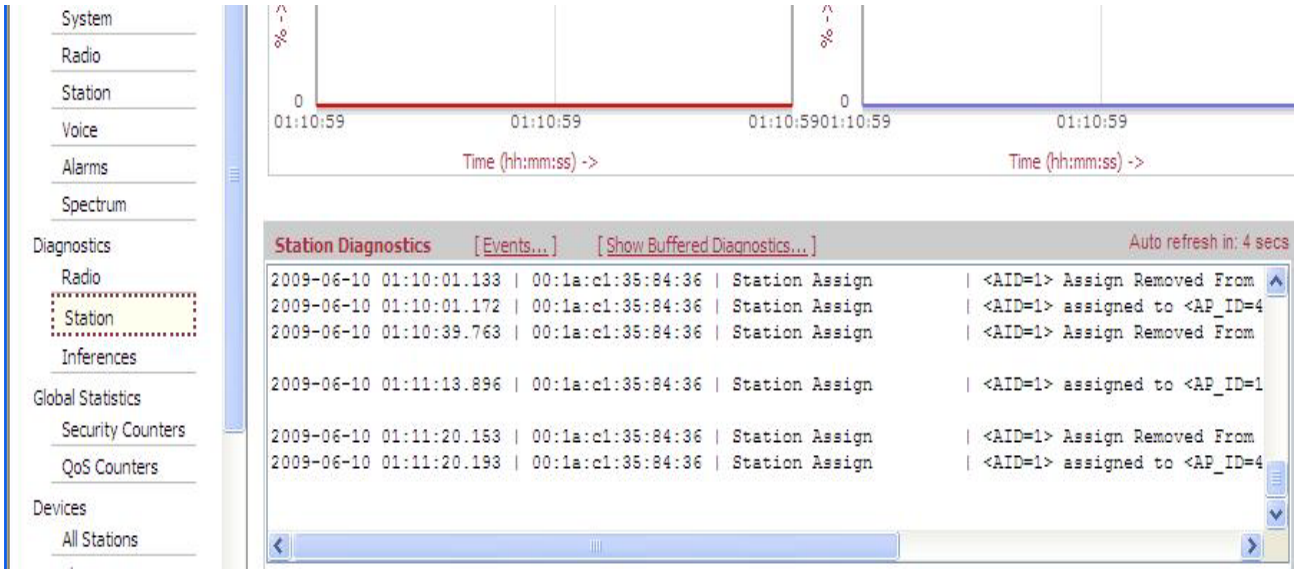
```
Meru01# configure terminal
Meru01(config)# diag-log
Meru01(config-diag-log)# admin station on
```

© 2012 Meru Networks, Inc.

What Else Can I learn From A Diagnostic Event?

Examine the details of a particular event by copying a MAC address from a Web UI screen such as **Figure 43**, pasting it into the Station Diagnostics window (**Monitor > Diagnostics > Station)** and then clicking **Start Diagnostics.**

Figure 45: Results of pasting a MAC address into the Station Diagnostics window



Scroll down to the bottom of the screen and click **Show Buffered Diagnostics**.

Capturing Packets

With the **packet-capture-profile** commands, you can capture packets from either a controller's local interface or capture over the air from access points. The **packet-capture-profile** commands work on AP300/AP400 and AP1000. (For packet capture on AP150, use the legacy command **capture-packets**.)

Once packets are captured, you have three options for using them. You can see packet captures in real time, save them to a file for future offline analysis, or send them to an IDS program or device.

The CLI command **packet-capture-profile** supports a capture of a file up to 10Mg. Make sure that the directory captive is empty before using the command **packet-capture-profile.** With the **packet-capture-profile** commands, you can forward packet captures from APs directly to external devices without storing packets locally on the controller. This eliminates the restriction on the file size of the packet capture (you are not limited by controller memory) and also allows the

 © 2012 Meru Networks, Inc.

captured information to be stored and archived externally. Use these CLI commands to send captured packets from APs to a hardware device or program. This command is required to use Location Manager.

To Do this:	Using this command:
Enter pcap mode and create a packet capture profile.	**packet-capture-profile** either updates an existing profile or creates a new profile and then enters pcap mode where the rest of these commands are used.
Determine which APs will send packets.	**ap-list** determines which APs will send packets. You must type each AP name one by one, separated by commas. At this time there is no all option or range ability. This list is limited by buffer space; you can enter 1, 2, 3,...90 without exceeding the limit. We recommend that you create the list in an application such as Notepad and then paste it into the command because if you exceed the buffer size, the command fails and you have to retype the entire list of APs again. If your list of APs exceeds the buffer size, you can create another profile that covers the rest of the APs.
Indicate packet destination. Indicate which port to use.	**mode** sets the transmit mode to layer2 or layer3, names the destination IP and names the port that should be used. Port 9177 is used for Location Manager and 17777 can be used for debugging.
Determine the biggest packet size that you want an AP to send.	**packet-truncation-length** sets packet capture truncation length. Default is 0 for troubleshooting and operation with WIPS. 82 is used for Location Manager.
Decide if you want to limit the rate at which packets are sent.	**rate-limiting** sets the packet capture rate limit to per-station or cumulative. **! Note:** Currently, if rate limiting is **on**, packets are limited only for per-station.
Determine whether you want to capture packets going to the AP, coming from the AP, or both. Only one option is available in System Director 5.1: packets going to the AP.	**rxtx** sets traffic intrusion detection to received traffic, sent traffic, or both. .
Limit bandwidth used.	**token-bucket-rate** sets the token bucket rate.

© 2012 Meru Networks, Inc.

To Do this:	Using this command:
Limit bandwidth used.	**token-bucket-size** sets the token bucket size.
Download the configuration to the APs and start capturing packets.	**enable-profile** turns on a packet capture profile.

For a detailed explanation of all packet capture commands, see the Troubleshooting chapter of the *Meru System Director Command Reference*.

Packet Capture Profile Example - WireShark

To do this, you need an external system running WireShark. This example creates the packet-capture-profile named Sniffer on a controller and then forwards the captured packets in layer 3 mode from AP-16 to WireShark on port #17777. Port 17777 is the port where WireShark is listening for incoming packets in L3 mode on a remote machine with IP address 1.1.1.1.

```
MC3K-1#
MC3K-1# configure terminal
MC3K-1(config)# packet-capture-profile Sniffer
MC3K-1(config-pcap)# mode l3 destination-ip 1.1.1.1 port 17777
MC3K-1(config-pcap)# ap-list 16
MC3K-1 (config-pcap)# enable-profile
MC3K-1(config-pcap)# exit
MC3K-1(config)# exit
MC3K-1# show packet-capture-profile Sniffer
AP Packet Capture profiles

Packet Capture Profile Name            : Sniffer
Packet Capture profile Enable/Disable   : off
Modes Allowed L2/L3                     : l3
Destination IP Address                  : 1.1.1.1

MC3K-1#
```

For a detailed explanation of the packet capture profile commands, see the Trouble-shooting chapter of the *Meru System Director Command Reference*. (This cannot be done from the Web UI.)

 © 2012 Meru Networks, Inc.

What to Look For In Capture-Packet Results

When discovery is via L3, the results of **capture-packet** should be a UDP port 9292 packet from the AP to the controller followed by a second UDP 9292 packet from the controller to the AP.

After the two UDP packets, there should be about nine UDP port 5000 packets. Check the time deltas between packets; there should only be tenths of a second between packets. Usually, the fifth UDP 5000 packet is from the AP to the controller and is the first one to contain the certificate used for authentication. Immediately following the certificate packet should be a packet from controller to the AP using UDP port 5000 that also contains a certificate.

What to Look For In the Discovery Log

The key messages from a successful discovery message trace are:

```
COMM: CSDS_REQUEST_DISCOVERY message
COMM: Discovery request from <AP MAC address>/<AP IP Address> received
   [skip unimportant messages]
COMM: Searching redirect entry for ipAddr 192.168.10.53
   [skip unimportant messages]
COMM: Trying to check-out <n> licenses for feature "ap".
COMM: lc_checkout OK for feature "ap". Now, <n> licenses have been checked
   out
COMM: Response msg to ATS <AP MAC address>/<AP IP Address>
   [skip unimportant messages]
COMM: Starting ATS script as: /opt/meru/bin/meru-wnc-ats start 3 8 1 1
Result: Registered virtual device '<AP MAC address>'
COMM: State file /opt/meru/var/run/discovery.state successfully written.
[skip unimportant messages]
COMM: authentication message 0 with payload type 0 from --- 3:8:37
COMM: /CN=meru AP/ST=California/C=US/Email=support@merunetworks.com - OK
   [skip unimportant messages]
COMM: AuthMgr::ProcessAccept: 3:8 new key 8f 8e eb ...
One example of the messages you would see when discovery failed because of
   a licensing issue is:
COMM: Trying to check-out 1 licenses for feature "ap".
COMM: Checking out one more license for AP failed. FlexRetCode = -9
COMM: lc_checkout FAIL
COMM: AP-1 00:0C:E6:00:2C:96 failed licensing
```

Also, check the following in the discovery log:

- Does the output of the command **sh license** show the same or more licenses than there are APs?
- Does the output of the command **show license-file active** show a system ID something like HOSTID=COMPOSITE=<*controller system id*> that agrees with the system ID outputted by the command **sh controller**?

FTP Error Codes

This section lists the possible error codes for FTP downloads. The codes are industry standard reporting codes.

- **100 Codes**—The requested action is being taken. Expect a reply before proceeding with a new command.

  110 Restart marker reply.In this case, the text is exact and not left to the particular implementation; it must read: MARK yyyy = mmmm Where yyyy is User-process data stream marker, and mmmm server's equivalent marker (note the spaces between markers and "=").

  120 Service ready in (n) minutes.

  125 Data connection already open, transfer starting.

  150 File status okay, about to open data connection.

  150 File status okay; about to open data connection.

- **200 Codes**—The requested action has been successfully completed.

  200 Command okay.

  202 Command not implemented, superfluous at this site.

  211 System status, or system help reply.

  212 Directory status.

  213 File status.

  214 Help message. On how to use the server or the meaning of a particular non-standard command. This reply is useful only to the human user.

  215 NAME system type. Where NAME is an official system name from the list in the Assigned Numbers document.

  220 Service ready for new user.

  221 Service closing control connection. Logged out if appropriate.

  225 Data connection open; no transfer in progress.

  226 Closing data connection. Requested file action successful (for example, file transfer or file abort).

  227 Entering Passive Mode (h1,h2,h3,h4,p1,p2).

  230 User logged in, proceed.

  250 Requested file action okay, completed.

  257 "PATHNAME" created.

- **300 Codes**—The command has been accepted, but the requested action is being held pending receipt of further information.

  331 User name okay, need password.

  332 Need account for login.

  350 Requested file action pending further information.

- **400 Codes**—The command was not accepted and the requested action did not take place. The error condition is temporary, however, and the action may be requested again.

 © 2012 Meru Networks, Inc.

421 Service not available, closing control connection. (May be a reply to any command if the service knows it must shut down.)`

425 Can't open data connection.

426 Connection closed; transfer aborted.

450 Requested file action not taken. File unavailable (e.g., file busy).

451 Requested action aborted: local error in processing.

452 Requested action not taken. Insufficient storage space in system.

- **500 Codes**—The command was not accepted and the requested action did not take place.

  500 Syntax error, command unrecognized. This may include errors such as command line too long.

  501 Syntax error in parameters or arguments.

  502 Command not implemented.

  503 Bad sequence of commands.

  504 Command not implemented for that parameter.

  530 User not logged in.

  532 Need account for storing files.

  550 Requested action not taken. File unavailable (e.g., file not found, no access).

  551 Requested action aborted: page type unknown.

  552 Requested file action aborted. Exceeded storage allocation (for current directory or dataset).

  553 Requested action not taken. Illegal file name.

Chapter 19
Alarms

No.	Alarm	Severity	Source	Explanation
1.	Alarm link up	information	all controller models	Physical link on controller is up.
2.	Alarm link down	critical	all controller models	Physical link on the controller is down; check the connection.
3.	Alarm auth fail	information	controller models	An administrator failed to log in to the GUI due to an authentication failure.
4.	AP down	critical	all AP models	An AP is down. Possible reasons for this are an AP reboot, an AP crash, or an Ethernet cable from the controller may be down. Also the AP may have connected to another controller.
5.	Radio Failure	critical	all AP models	An alarm is generated when the Radio fails to turn operational during Initial bootup. This is occurred due to some Hardware issue on the AP Radio.
6.	Rogue AP detected	critical	all controller models	A rogue AP has been detected on the network. The message looks something like this: Rogue AP Detected Critical 06/04/2010 10:04:51 CONTROLLER (1:24194) ROGUE AP DETECTED. Station mac=0c:60:76:2d:fe:d9 bss=00:02:6f:3a:fd:89 by AP Ben-Cubei (18) See the chapter **Rogue AP Detection and Mitigation**.

No.	Alarm	Severity	Source	Explanation
7.	AP software version mismatch	critical	all AP models	The software version on the AP does not match the version on the controller. Automatic AP upgrade must have been turned off. Update the AP from the controller with either the CLI command **upgrade ap same <*ap id*> force** or **upgrade ap same all force**. You can also turn automatic upgrade back on by with the CLI command **auto-ap-upgrade enable**.
8.	AP init failure	major	all AP models	AP initialization failed.
9.	Software license expired	major	all controller models	Controller software license has expired. To obtain additional licenses, see **www.merunetworks.com/license**.
10.	802.1X auth failure	major, minor, information	all controller models	Radius server authentication failed. To find out why, look at the Radius server log for the error message and also check the station log. If this happens only occasionally, you can ignore it. However, if this message appears repeatedly, the authentication failures could prevent a station from entering the network. In this case, check the Radius server to make sure the client and server have the same credentials.
11.	MIC failure AP	major	all controller models	The Michael MIC Authenticator Tx/Rx Keys provided in the Group Key Handshake are only used if the network is using TKIP to encrypt the data. A failure of the Michael MIC in a packet usually indicates that the WPA WPSK password is wrong.
12.	MIC countermeasure activation	major	all controller models	Two consecutive MIC failures have occurred (see above).

© 2012 Meru Networks, Inc.

No.	Alarm	Severity	Source	Explanation
13.	Radius Server Switchover	major	all controller models	A switchover from the Primary Authentication Radius Server to the Secondary Authentication Radius Server occurred. When this message occurs, the Primary Radius server is configured but not reachable and the Secondary Radius server is both configured and reachable. This message is generated only for 802.1x switchover, not for Captive Portal switchover. An example looks like this: Radius Server Switchover Major 06/07/2010 14:09:57 Radius Server switches over from Primary <172.18.1.7> to Secondary <172.18.1.3> for Profile <wpa>
14.	Radius Server Switchover Failed	major	all controller models	A switchover from the Primary Authentication Radius Server to the Secondary Authentication Radius Server failed because the secondary server is not configured. When this message occurs, the Primary Radius server is configured but not reachable and the Secondary Radius server is not configured. This message is generated only for 802.1x switchover failure, not for Captive Portal switchover failure. An example looks like this: Radius Server Switchover Failed Major 06/07/2010 14:02:47 Primary Radius Server <172.18.1.7> failed. No valid Secondary Radius Server present. Switchover FAILED for Profile <wpa> Alarms Table(1 entry)

No.	Alarm	Severity	Source	Explanation
15.	Restore Primary Radius Server	major	all controller models	A switchover from the Secondary Authentication Radius Server to the Primary Authentication Radius Server occurred. This alarm was generated while doing Radius fall back to the primary server after 15 minutes. This message is generated only for 802.1x primary Radius restore, not for Captive Portal restore. An example looks like this: Restore Primary Radius Server Major 06/07/2010 15:54:10 Security Profile <wpa> restored back to the Primary Radius server <172.18.1.7>
16.	Acct Radius server switchover	major	all controller models	A switchover from either Accounting Radius Server (primary or secondary) to the other one occurred. This message is generated only for 802.1x switchover, not for Captive Portal switchover. An example when the primary to secondary switch occurred looks like this: Accounting Radius Server Switch Major 06/07/2010 14:39:00 Accounting Radius Server switches over from Primary <172.18.1.7> to Secondary <172.18.1.3> for Profile <wpa>

© 2012 Meru Networks, Inc.

No.	Alarm	Severity	Source	Explanation
17.	Acct Radius server switchover failed	major	all controller models	An attempted switchover from one Accounting Radius Server to the other server failed.When this message occurs, the Primary Accounting Radius server is configured but not reachable and the Secondary Accounting Radius server is not configured. This message is generated only for 802.1x switchover failure, not for Captive Portal switchover fail lure. An example looks like this: Accounting Radius Server Switch Major 06/07/2010 14:22:26 Primary Accounting Radius Server <172.18.1.7> failed. No valid Secondary Accounting Radius Server present. Switchover FAILED for Profile <wpa>
18.	Master down	critical	all controller models	N+1 Master controller is down and no longer in control; the slave controller will now take over.
19.	Master up	critical	all controller models	N+1 Master controller is up and running; this controller will now take control away from the slave controller.
20.	CAC limit reached	major	all controller models	Admission control in ATM networks is known as Connection Admission Control (CAC) - this process determines which traffic is admitted into a network. If this message occurs, the maximum amount of traffic is now occurring on the network and no more can be added.
21.	N-Upgrade License checkout failed	major	AP301, AP302, AP311	An 11N license is not available to support 11n mode for the specified AP300. You can either obtain an N license or reconfigure the AP to ABG mode. See the System Director Release Notes for directions.

Glossary

This glossary contains a collection of terms and abbreviations used in this document.

A B C D E F G H I J K L M N O P Q R S T U V W X Y

Numerals

10BaseT An IEEE standard (802.3) for operating 10 megabits per second (Mbps) Ethernet networks (LANs) over twisted pair cabling and using baseband transmission methods.

100baseT A Fast Ethernet standard (802.3u) that allows up to 100 Mbps and uses the **CSMA/CD** LAN access method.

3DES Triple Des. A Data Encryption Standard (DES) that uses three 64-bit encryption key, and therefore is three times longer than that used by DES.

802.11 802.11, or IEEE 802.11, is a radio technology specification used for Wireless Local Area Networks (**WLAN**s). 802.11 defines the mobile (wireless) network access link layer, including 802.11 media access control (MAC) and different Physical (PHY) interfaces. This standard defines the protocol for communications between a wireless client and a base station as well as between two wireless clients.

The 802.11 specification, often called Wi-Fi, is composed of several standards operating in different radio frequencies, including the 2.4 GHz (802.11 b and g) and 5 GHz (802.11a) unlicensed spectrums. New standards are emerging within the 802.11 specification to define additional aspects of wireless networking.

802.11a A supplement to 802.11 that operates in the 5 GHz frequency range with a maximum 54 Mbps data transfer rate. The 802.11a specification offers more radio channels than the 802.11b and uses **OFDM**. The additional channels ease radio and microwave interference.

802.11b International standard for wireless networking that operates in the 2.4 GHz frequency range (2.4 GHz to 2.4835 GHz) and provides a throughput of up to 11 Mbps. This common frequency is also used by microwave ovens, cordless phones, medical and scientific equipment, as well as Bluetooth devices.

802.11e An IEEE specification for providing Quality of Service (QoS) in 802.11 WLANs. 802.11e is a supplement to the IEEE 802.11 and provides enhancements to the 802.11 MAC layer supplying a Time Division Multiple Access (TDMA) construct and error-correcting mechanisms that aid delay-sensitive applications such as voice and video.

802.11g Similar to 802.11b, this standard operates in the 2.4 GHz frequency. It uses **OFDM** to provide a throughput of up to 54 Mbps.

© 2012 Meru Networks, Inc.

802.11i Supports the 128-bit Advanced Encryption Standard (AES) and Temporal Key Integrity Protocol (TKIP) along with 802.1X authentication and key management features for increased WLAN security capabilities.

802.11j Provides enhancements to the current 802.11 standard to support the 4.9GHz - 5GHz band for operations in Japan.

802.11k Due for ratification in 2005, the 802.11k Radio Resource Management standard will provide measurement information for access points and switches to make Wireless LANs run more efficiently.

802.11n An emerging standard aimed at providing greater than 100 Mbps of throughput in a wireless environment.

802.11r A specification under development to improve a wireless client's ability to roam across wireless networks.

802.16 A specification for fixed broadband wireless metropolitan access networks (MANs) that uses a point-to-multipoint architecture. The standard defines the use of bandwidth between the licensed 10GHz and 66GHz bands and between the 2GHZ and 11GHz (licensed and unlicensed) frequency ranges. 802.16 supports very high bit rates for a distance of approximately 30 miles.

802.1X Wireless LAN security implementation that uses port-based authentication between an operating system and the network access device, meant to increase security in user authentication by using Radius, Extensible Authentication Protocol (EAP), and LDAP.

A

AAA **authentication**, **authorization**, and **accounting** (triple A). An IP-based system for providing services to ensure secure network connections for users. The system requires a server such as a Radius server to enforce these services.

access point A device that is managed by a **controller** and that allows **station**s such as cellular phones or laptops to communicate wirelessly with the Meru Wireless LAN System.

accounting Services that track the resources a user session uses such as amount of time logged on, data transferred, resources, etc. Accounting services are typically used for billing, auditing, analysis, etc.

ACL Access Control List. A list kept by the controller to limit access of station to the WLAN. The ACL can be a permit, deny, or Radius Server list of MAC addresses of the NIC device within the station. An ACL is controller by the configured state, either enabled or disabled.

AES Advanced Encryption Standard. An encryption standard that uses a symmetric encryption algorithm (Rijndael). AES was chosen by the National Information and Standards Institute (NIST) as the Federal Information Processing Standard (FIPS).

Air Traffic Control Meru technology that exercises a high degree of control over all transmissions within a wireless network. Unlike superficially similar technologies from other vendors, Air Traffic Control technology coordinates uplink and downlink transmissions on a single 802.11 channel in such a manner that the effects of co-channel and adjacent channel interference

 © 2012 Meru Networks, Inc.

are eliminated and all access points on a network can share a single radio channel. It also load balances traffic across channels when using Channel Layering, ensuring that each channel

ATS Access Transaction Station. Alternative term for *access point*.

attenuation The reduction of RF signal strength due to the presence of an obstacle, such as a wall or person. The amount of attenuation caused by a particular object will vary depending upon its composition.

authentication The process of identifying a user, usually based on a username and password, but can also be a MAC address.

authorization The process of granting or denying a user access to network resources once the user has been authenticated through the username and password.

B

backbone The central part of a large network that links two or more subnetworks and is the primary path for data transmission for a large business or corporation. A network can have a wired backbone or a wireless backbone.

bandwidth The amount of transmission capacity that is available on a network at any point in time. Available bandwidth depends on several variables such as the rate of data transmission speed between networked devices, network overhead, number of users, and the type of device used to connect PCs to a network. It is similar to a pipeline in that capacity is determined by size: the wider the pipe, the more water can flow through it; the more bandwidth a network provides, the more data can flow through it. Standard 802.11b provides a bandwidth of 11 Mbps; 802.11a and 802.11g provide a bandwidth of 54 Mbps. These are the raw capabilities of the network. Many things conspire to reduce these values, including protocol overhead, collisions, and implementation inefficiencies.

base station A term in cellular networking that refers to a radio transmitter/receiver that maintains communications with mobile radiotelephone sets within a given range (typically a cell site).

bps bits per second. A measure of data transmission speed over communication lines based on the number of bits that can be sent or received per second. Bits per second-bps-is often confused with bytes per second-Bps. 8 bits make a byte, so if a wireless network is operating at a bandwidth of 11 megabits per second (11 Mbps or 11 Mbits/sec), it is sending data at 1.375 megabytes per second (1.375 MBps).

bridge A product that connects a local area network (LAN) to another local area network that uses the same protocol (for example, wireless, Ethernet or token ring). Wireless bridges are commonly used to link buildings in campuses.

BSC Base Station Controller. Manages radio resources and controls handoff between cells. May also contain the transcoder for compressing/uncompressing voice between cellular network and the Public Switched Telephone Network (PSTN).

BSSID Basic Service Set Identifier is a means of uniquely identifying an **access point**, usually intended for machine use rather than human use. A 48-bit Ethernet MAC address is used to identify an 802.11 wireless service. In a Virtual Cell, all same-channel APs may appear to

have the same BSSID, thus virtualizing the network from the client's perspective. When Virtual Ports are used, each client sees a different BSSID, appearing to get its own private AP. See also **ESSID**.

C

Co-channel Interference Radio interference that occurs when two transmitters use the same frequency without being closely synchronized. Legacy wireless systems cannot achieve this kind of synchronization, so access points or cell towers that transmit on one channel must be spaced far apart. The result is coverage gaps that must be filled in with radios tuned to another channel, resulting in an inefficient and complex microcell architecture. Air Traffic Control technology avoids co-channel interference by tightly synchronizing access point transmissions, enabling that adjacent APs to use the same channel.

Channel Bonding The combination of two non-overlapping 20 MHz. channels into a single 40 MHz. channel, doubling the amount of data that can be transmitted in a given time but halving the number of available channels. Along with MIMO, it is a key innovation in the 802.11n standard.

Channel Layering Wireless LAN architecture in which several Virtual Cells are located in the same physical space but on non-overlapping channels, multiplying the available capacity. This additional capacity can be used for redundancy or to support higher data rates or user density. It can be enabled through multiple radios on one AP or by using multiple AP close together, so the total capacity is limited only be the number of non-overlapping channels available.

Channel Reuse A pattern in which different APs can use the same channel. In microcell networks, such APs need to be placed far apart to avoid co-channel interference, meaning that contiguous coverage requires multiple channels. In networks using Air Traffic Control technology, the same channel can be reused throughout the network, meaning that only one channel is required and others are left free for other purposes.

CHAP Challenge Handshake Authentication Protocol. An authentication protocol that defines a three-way handshake to authenticate a user. CHAP uses the MD5 hash algorithm to generate a response to a challenge that can be checked by the authenticator.

CLI Command-line interpreter. On a **controller** and other units, this is similar to a command shell for giving instructions.

client Any computer connected to a network that requests services (files, print capability) from another member of the network.

client devices Clients are end users. Wi-Fi client devices include PC Cards that slide into laptop computers, mini-PCI modules embedded in laptop computers and mobile computing devices, as well as USB radios and PCI/ISA bus Wi-Fi radios. Client devices usually communicate with hub devices like access points and gateways.

collision avoidance A network node characteristic for proactively detecting that it can transmit a signal without risking a collision.

controller A device that is responsible for configuring and integrating the **access point**s in a WLAN.

© 2012 Meru Networks, Inc.

CSMA-CA CSMA/CA is the principle medium access method employed by IEEE 802.11 WLANs. It is a "listen before talk" method of minimizing (but not eliminating) collisions caused by simultaneous transmission by multiple radios. IEEE 802.11 states collision avoidance method rather than collision detection must be used, because the standard employs half duplex radios-radios capable of transmission or reception-but not both simultaneously.

CSMA/CD A method of managing traffic and reducing noise on an Ethernet network. A network device transmits data after detecting that a channel is available. However, if two devices transmit data simultaneously, the sending devices detect a collision and retransmit after a random time delay.

D

dBm A measurement of relative power (decibel) related to 1 milliwatt (mW).

Denial of Service (DoS) A condition in which users are deliberately prevented from using network resources.

DES Data Encryption Standard. A symmetric encryption algorithm that always uses 56 bit keys. It is rapidly being replaced by its more secure successor, 3DES.

DHCP A utility that enables a server to dynamically assign IP addresses from a predefined list for a predefined time period, limiting their use time so that they can be reassigned. Without DHCP, IP addresses would have to be manually assigned to all computers on the network. When DHCP is used, whenever a computer logs onto the network, it automatically is assigned an IP address.

DNS A program that translates URLs to IP addresses by accessing a database maintained on a collection of Internet servers. The program works behind the scenes to facilitate surfing the Web with alpha versus numeric addresses. A DNS server converts a name like mywebsite.com to a series of numbers like 107.22.55.26. Every website has its own specific IP address on the Internet.

DSL Various technology protocols for high-speed data, voice and video transmission over ordinary twisted-pair copper POTS (Plain Old Telephone Service) telephone wires.

E

EAP Extensible Authentication Protocol. An extension to PPP. EAP is a general protocol for authentication that also supports multiple authentication methods, such as token cards, Kerberos, one-time passwords, certificates, public key authentication and smart cards. IEEE 802.1x specifies how EAP should be encapsulated in LAN frames.

EAP-TLS Extensible Authentication Protocol with Transport Layer Security. EAP-TLS supports mutual authentication using digital certificates. When a client requests access, the authentication server responds with a server certificate. The client replies with its own certificate and also validates the server certificate. The certificate values are used to derive session encryption keys.

© 2012 Meru Networks, Inc.

EAP - TTLS Extensible Authentication Protocol with Tunneled Transport Layer Security. EAP-TTLS uses a combination of certificates and password challenge and response for authentication within an 802.1X environment. TTLS supports authentication methods defined by EAP, as well as the older Challenge Handshake Authentication Protocol (CHAP), Password Authentication Protocol (PAP), Microsoft CHAP (MS-CHAP), and MS-CHAPV2.

encryption key An alphanumeric (letters and/or numbers) series that enables data to be encrypted and then decrypted so it can be safely shared among members of a network. WEP uses an encryption key that automatically encrypts outgoing wireless data. On the receiving side, the same encryption key enables the computer to automatically decrypt the information so it can be read.

enterprise A term that is often applied to large corporations and businesses. The enterprise market can incorporate office buildings, manufacturing plants, warehouses and R&D facilities, as well as large colleges and universities.

ESSID Extended Service Set Identifier (ID). The identifying name of an 802.11 wireless network, which is a string of up to 32 characters that is intended to be viewed by humans. When you specify an ESSID in your client setup, you ensure that you connect to your wireless network rather than another network in range.

A set of access points can share an ESSID. In this case, a **station** can roam among the access points.

Ethernet International standard networking technology for wired implementations. Basic 10BaseT networks offer a bandwidth of about 10 Mbps. Fast Ethernet (100 Mbps) and Gigabit Ethernet (1000 Mbps) are becoming popular.

F

FCC Federal Communications Commission. The United States' governing body for telecommunications law.

firewall A system that secures a network and prevents access by unauthorized users. Firewalls can be software, hardware or a combination of both. Firewalls can prevent unrestricted access into a network, as well as restrict data from flowing out of a network.

Fourth Generation Term coined by analyst firm Gartner to describe a wireless LAN system in which the controller governs handoffs, such as one utilizing Virtual Cells. This is contrasted with third generation (micro-cell architecture) systems, in which the controller is only responsible for managing access points and clients must decide for themselves when to initiate a handoff. Second generation systems lacked a controller altogether and were designed for standalone operation, whereas the first generation used proprietary, non-802.11 systems.

G

gain The ratio of the power output to the power input of an amplifier in dB. The gain is specified in the linear operating range of the amplifier where a 1 dB increase in input power gives rise to a 1 dB increase in output power.

© 2012 Meru Networks, Inc.

gateway In the wireless world, a gateway is an access point with additional software capabilities such as providing NAT and DHCP. Gateways may also provide VPN support, roaming, firewalls, various levels of security, etc.

H

Handoff The transfer of a link from one access point to another as a client moves through a network. In legacy microcell networks, Wi-Fi clients are responsible for handoff, meaning that the quality of the link and the overall network performance is dependent on each client's implementation of 802.11 roaming algorithms. In Virtual Cell and Virtual Port networks, the network itself governs handoffs as clients remain connected to a single virtual AP.

hotspot A place where you can access Wi-Fi service. This can be for free or for a fee. HotSpots can be inside a coffeeshop, airport lounge, train station, convention center, hotel or any other public meeting area. Corporations and campuses are also implementing HotSpots to provide wireless Internet access to their visitors and guests. In some parts of the world, HotSpots are known as CoolSpots.

hub A multiport device used to connect PCs to a network via Ethernet cabling or via Wi-Fi. Wired hubs can have numerous ports and can transmit data at speeds ranging from 10 Mbps to multigigabyte speeds per second. A hub transmits packets it receives to all the connected ports. A small wired hub may only connect 4 computers; a large hub can connect 48 or more. Wireless hubs can connect hundreds.

Hz The international unit for measuring frequency, equivalent to the older unit of cycles per second. One megahertz (MHz) is one million hertz. One gigahertz (GHz) is one billion hertz. The standard US electrical power frequency is 60 Hz, the AM broadcast radio frequency band is 535-1605 kHz, the FM broadcast radio frequency band is 88-108 MHz, and Wireless 802.11b LANs operate at 2.4 GHz.

I

IP number Also called an IP address. A 32-bit binary number that identifies senders and receivers of traffic across the Internet. It is usually expressed in the form *nnn.nnn.nnn.nnn* where *nnn* is a number from 0 to 256.

identity-based networking A concept whereby WLAN policies are assigned and enforced based upon a wireless client's identity, as opposed to its physical location. With identity networking, wireless devices need only authenticate once with a WLAN system. Context information will follow the devices as they roam, ensuring seamless mobility.

IEEE Institute of Electrical and Electronics Engineers. (www.ieee.org) A membership organization that includes engineers, scientists and students in electronics and allied fields. It has more than 300,000 members and is involved with setting standards for computers and communications.

IEEE 802.11 A set of specifications for LANs from The Institute of Electrical and Electronics Engineers (IEEE). Most wired networks conform to 802.3, the specification for CSMA/CD based Ethernet networks or 802.5, the specification for token ring networks. 802.11 defines the standard for Wireless LANs encompassing three incompatible (non-interoperable) technol-

© 2012 Meru Networks, Inc.

ogies: Frequency Hopping Spread Spectrum (FHSS), Direct Sequence Spread Spectrum (DSSS) and Infrared. WECA's focus is on 802.11b, an 11 Mbps high-rate DSSS standard for wireless networks.

infrastructure mode A client setting providing connectivity to an AP. As compared to Ad-Hoc mode, whereby PCs communicate directly with each other, clients set in Infrastructure Mode all pass data through a central AP. The AP not only mediates wireless network traffic in the immediate neighborhood, but also provides communication with the wired network. See Ad-Hoc and AP.

IP Internet Protocol. A set of rules used to send and receive messages at the Internet address level.

IP telephony Technology that supports voice, data and video transmission via IP-based LANs, WANs, and the Internet. This includes VoIP (Voice over IP).

IP address A 32-bit number that identifies each sender or receiver of information that is sent across the Internet. An IP address has two parts: an identifier of a particular network on the Internet and an identifier of the particular device (which can be a server or a workstation) within that network.

IPSec IPSec is a security protocol from the Internet Engineering Task Force (IETF) that provides authentication and encryption. IPsec, which works at Layer 3, is widely used to secure VPNs and wireless users. Some vendors, like Airespace, have implemented special WLAN features that allow IPsec sessions to roam with clients for secure mobility.

ISDN A type of broadband Internet connection that provides digital service from the customer's premises to the dial-up telephone network. ISDN uses standard POTS copper wiring to deliver voice, data or video.

ISO network model A network model developed by the International Standards Organization (ISO) that consists of seven different levels, or layers. By standardizing these layers, and the interfaces in between, different portions of a given protocol can be modified or changed as technologies advance or systems requirements are altered. The seven layers are:

- Physical
- Data Link
- Network
- Transport
- Session
- Presentation
- Application

The IEEE 802.11 Standard encompasses the physical layer (PHY) and the lower portion of the data link layer. The lower portion of the data link layer is often referred to as the Medium Access Controller (MAC) sublayer.

 © 2012 Meru Networks, Inc.

J

K

L

LAN Local Area Network. A system of connecting PCs and other devices within the same physical proximity for sharing resources such as an Internet connections, printers, files and drives. When Wi-Fi is used to connect the devices, the system is known as a Wireless LAN or WLAN.

LDAP Lightweight Directory Access Protocol. A set of protocols for accessing information directories conforming to the X.500 standard.

LWAPP Lightweight Access Point Protocol. A proposed specification to the International Engineering Task Force (IETF) created to standardize the communications protocol between access points and WLAN system devices (switches, appliances, routers, etc.). Initial authors include Airespace and NTT DoCoMo. See CAPWAP

M

MAC Medium Access Control. This is the function of a network controller that determines who gets to transmit when. Each network adapter must be uniquely identified. Every wireless 802.11 device has its own specific MAC address hard-coded into it. This unique identifier can be used to provide security for wireless networks. When a network uses a MAC table, only the 802.11 radios that have had their MAC addresses added to that network's MAC table will be able to get onto the network.

Man in Middle (MiM) An attack that results from the interception and possible modification of traffic passing between two communicating parties, such as a wireless client and Access Point. MIM attacks succeed if the systems can't distinguish communications with an intended recipient from those with the intervening attacker.

Mbps Million bits (megabits) per second.

MIC Message Integrity Check. MIC is part of a draft standard from IEEE 802.11i working group. It is an additional 8 byte field which is placed between the data portion of an 802.11 (Wi-Fi) frame and the 4 byte ICV (Integrity Check Value) to protect both the payload and the header. The algorithm which implements the MIC is known as Michael.

Microcell Wireless architecture in which adjacent APs must be tuned to different, non-overlapping channels in an attempt to mitigate co-channel interference. This requires complex channel planning both before the network is built and whenever a change is made, and uses spectrum so inefficiently that some co-channel interference still occurs, especially at 2,4 GHz. Microcell architectures were common in 2G cell phone systems and legacy wireless LAN systems. They are not used in 3G cellular networks or in wireless LAN systems that use Air Traffic Control, as these allow all access points to share a single channel.

© 2012 Meru Networks, Inc.

mobile professional A salesperson or a "road warrior" who travels frequently and requires the ability to regularly access his or her corporate networks, via the Internet, to post and retrieve files and data and to send and receive e-mail.

multipath The process or condition in which radiation travels between source and receiver via more than one propagation path due to reflection, refraction, or scattering.

N

NAT NetwOrk Address Translation. A system for converting the IP numbers used in one network to the IP numbers used in another network. Usually one network is the internal network and one network is the external network. Usually the internal IP numbers form a relatively large set of IP numbers, which must be compressed into a small set of IP numbers for the external network.

network name Identifies the wireless network for all the shared components. During the installation process for most wireless networks, you need to enter the network name or SSID. Different network names are used when setting up your individual computer, wired network or workgroup.

NIC Network Interface Card. A type of PC adapter card that either works without wires (Wi-Fi) or attaches to a network cable to provide two-way communication between the computer and network devices such as a hub or switch. Most office wired NICs operate at 10 Mbps (Ethernet), 100 Mbps (Fast Ethernet) or 10/100 Mbps dual speed. High-speed Gigabit and 10 Gigabit NIC cards are also available. See *PC Card.*

O

OFDM Orthogonal Frequency Division Multiplexing. A modulation technique for transmitting large amounts of digital data over a radio wave. OFDM splits the radio signal into multiple smaller signals that are transmitted in parallel at different frequencies to the receiver. OFDM reduces the amount of crosstalk in signal transmissions. 802.11a uses OFDM.

Overlay Network A dedicated network of radio sensors that are similar to access points but do not serve clients, scanning the airwaves full time for security or management issues. Overlay networks lack the flexibility of AP-based scanning, as radios cannot be redeployed between scanning and client access. They also lack deep integration with the main wireless network, necessary for real-time management and intrusion prevention.

P

Partitioning Virtualization technique in which a single resource is divided up into virtual resources that are then dedicated to a particular application. Examples include the virtual machines in server virtualization, virtual disk drives in SANs and Virtual Ports in Meru's Wireless LAN Virtualization. The main advantages of partitioning are control and isolation: Each application or user can be given exactly the resources that it needs, protecting them from each other and ensuring that none consumes more than its allocated share of resources. In a wireless context, it makes a wireless LAN behave more like a switched Ethernet port.

© 2012 Meru Networks, Inc.

Pooling Virtualization technique in which multiple physical resources are combined into a single virtual resource. Examples include the multiple disk drives in a virtual storage array, the multiple CPUs in a modern server and the multiple access points in a Meru Virtual Cell. The main advantages of pooling are agility, simplified management and economies of scale: Resources can be moved between applications on demand, reducing the need for over-provisioning and freeing applications or users from dependence on a single piece of limited infrastructure.

PC card A removable, credit-card-sized memory or I/O device that fits into a Type 2 PCMCIA standard slot, PC Cards are used primarily in PCs, portable computers, PDAs and laptops. PC Card peripherals include Wi-Fi cards, memory cards, modems, NICs, hard drives, etc.

PCI A high-performance I/O computer bus used internally on most computers. Other bus types include ISA and AGP. PCIs and other computer buses enable the addition of internal cards that provide services and features not supported by the motherboard or other connectors.

PDA Smaller than laptop computers but with many of the same computing and communication capabilities, PDAs range greatly in size, complexity and functionality. PDAs can provide wireless connectivity via embedded Wi-Fi Card radios, slide-in PC Card radios, or Compact Flash Wi-Fi radios.

PEAP Protected Extensible Authentication Protocol. An extension to the Extensible Authentication Protocol with Transport Layer Security (EAP-TLS), developed by Microsoft Corporation. TLS is used in PEAP Part 1 to authenticate the server only, and thus avoids having to distribute user certificates to every client. PEAP Part 2 performs mutual authentication between the EAP client and the server.

peer-to-peer network A wireless or wired computer network that has no server or central hub or router. All the networked PCs are equally able to act as a network server or client, and each client computer can talk to all the other wireless computers without having to go through an access point or hub. However, since there is no central base station to monitor traffic or provide Internet access, the various signals can collide with each other, reducing overall performance.

PHY The lowest layer within the OSI Network Model. It deals primarily with transmission of the raw bit stream over the PHYsical transport medium. In the case of Wireless LANs, the transport medium is free space. The PHY defines parameters such as data rates, modulation method, signaling parameters, transmitter/receiver synchronization, etc. Within an actual radio implementation, the PHY corresponds to the radio front end and baseband signal processing sections.

plenum The ceiling plenum is the volume defined by the area above the back of the ceiling tile, and below the bottom of the structural slab above. Within this plenum is usually found a combination of HVAC ducts, electrical and electronic conduits, water pipes, traditional masking sound speakers, etc. Networking equipment needs to be plenum rated to certify that it is suitable for deployment in this area.

PoE Power over Ethernet. A technology defined by the IEEE 802.3af standard to deliver dc power over twisted-pair Ethernet data cables rather than power cords. The electrical current, which enters the data cable at the power-supply end and comes out at the device end, is kept separate from the data signal so neither interferes with the other.

© 2012 Meru Networks, Inc.

POTS Plain Old Telephone Service. Standard analog telephone service (an acronym for Plain Old Telephone Service).

proxy server Used in larger companies and organizations to improve network operations and security, a proxy server is able to prevent direct communication between two or more networks. The proxy server forwards allowable data requests to remote servers and/or responds to data requests directly from stored remote server data.

PSTN Public Switched Telephone Network. The usual way of making telephone calls in the late 20th century, designed around the idea of using wires and switches. Perhaps to be supplanted by Voice Over IP in the 21st century.

Q

QoS Quality of Service. A set of technologies for managing and allocating Internet bandwidth. Often used to ensure a level of service required to support the performance requirements of a specific application, user group, traffic flow, or other parameter. Defined within the service level are network service metrics that include network availability (uptime), latency and packet loss.

R

Radius Remote Authentication Dial-In User Service. A service that authorizes connecting users and allows them access to requested systems or services. The Microsoft ISA server is a Radius server.

range How far will your wireless network stretch? Most Wi-Fi systems will provide a range of a hundred feet or more. Depending on the environment and the type of antenna used, Wi-Fi signals can have a range of up to mile.

RC4 algorithm The RC4 algorithm uses an Initialization Vector (IV) and a secret key to generate a pseudo-random key stream with a high periodicity. Designed by RSA Security, RC4 is used in WEP and many other transmission protocols including SSL.

RF Radio Frequency. The type of transmission between a Wireless LAN access point and a wireless client (e.g., laptop, PDA, or phone). Wireless LANs can use RF spectrum at either 2.4 GHz (IEEE 802.11b or IEEE 802.11g) or 5 GHz (IEEE 802.11G).

RFID Radio Frequency ID. A device that picks up signals from and sends signals to a reader using radio frequency. Tags come in many forms, such as smart labels that are stuck on boxes; smart cards and key-chain wands for paying for things; and a box that you stick on your windshield to enable you to pay tolls without stopping. Most recently, active 802.11 RFID tags are being deployed in enterprise environments to provide more consistent tracking across farther distances than traditional passive devices.

RF fingerprinting In an enterprise WLAN scenario, RF fingerprinting refers to creating a blueprint of a building's RF characteristics, taking into account specific wall and design characteristics such as attenuation and multipath. This information is compared to real-time information collected by APs for 802.11 location tracking. By taking RF characteristics into account, RF fingerprint is the most accurate method of wireless device tracking available today.

© 2012 Meru Networks, Inc.

RF prediction The process of predicting WLAN characteristics, such as throughput and coverage area, based upon imported building characteristics and sample WLAN design configurations.

RF triangulation A common method used for 802.11 device tracking whereby 3 or more Access Points compare RSSI information to triangulate in on a device's location. While easy to implement, RF triangulation does not account for multipath, attenuation, and other RF characteristics that may affect receive sensitivity, making it less accurate than RF fingerprinting.

roaming The process that takes places as a client moves between the coverage areas of different APs, necessitating a handoff. In microcell Wi-Fi networks, roaming can be a complex procedure that risks dropped connections and drags down network performance, as the client is forced to decide when to disconnect from one AP and search for another. In networks using Virtual Cell and Virtual Port technology, the infrastructure controls roaming, automatically connecting each client to the optimum AP.

rogue Access Point An AP that is not authorized to operate within a wireless network. Rogue APs subvert the security of an enterprise network by allowing potentially unchallenged access to the enterprise network by any wireless user (client) in the physical vicinity.

RJ-45 Standard connectors used in Ethernet networks. Even though they look very similar to standard RJ-11 telephone connectors, RJ-45 connectors can have up to eight wires, whereas telephone connectors have only four.

roaming Moving seamlessly from one AP coverage area to another with no loss in connectivity.

router A device that forwards data packets from one local area network (LAN) or wide area network (WAN) to another. Based on routing tables and routing protocols, routers can read the network address in each transmitted frame and make a decision on how to send it via the most efficient route based on traffic load, line costs, speed, bad connections, etc.

RSA A public-key algorithm developed in 1977 and named after its inventors, Rivest, Shamir, and Adleman. RSA, currently owned by RSA Data Security, Inc., is used for encryption, digital signatures, and key exchange.

RSN Robust Security Network. A new standard within IEEE 802.11i to provide security and privacy mechanisms in an 802.11 wireless network. RSN leverages 802.1x authentication with Extensible Authentication Protocol (EAP) and AES for encryption.

RSSI Received Signal Strength Indication. The measured power of a received signal.

S

scanning The process of checking the airwaves for rogue access points or attackers. Scanning APs are typically implemented as an Overlay Network, as most APs can not scan and serve traffic at the same time. Meru's APs are able to scan the airwaves and serve clients simultaneously, eliminating the need for an overlay. Meru's single-channel architecture improves accuracy when scanning for intruders, as all APs are able to detect signals from all clients.

server A computer that provides its resources to other computers and devices on a network. These include print servers, Internet servers and data servers. A server can also be combined with a hub or router.

© 2012 Meru Networks, Inc.

	Single Channel Term sometimes used to describe a network in which all access points operate on the same channel, such as one using Virtual Cell technology. Single channel operation is more spectrally efficient than a microcell architecture and necessary for the use of Virtual Cells and network-controlled handoff. Single Channel improves security by making intrusion detection easier and location tracking more accurate, as every AP automatically receives transmissions from every client within range. It also enables the RF Barrier to function with as little as one radio, because only one channel needs to be blocked from outside access.
SIP	Session Initiation Protocol. SIP is a protocol for finding users, usually human, and setting up multimedia communication among them, typically a VoIP phone call.
site survey	The process whereby a wireless network installer inspects a location prior to putting in a wireless network. Site surveys are used to identify the radio- and client-use properties of a facility so that access points can be optimally placed. Meru Wireless LAN System WLANs are optimized to not require a site survey.
spectral efficiency	The ratio of data rate to radio spectrum usage. A Virtual Cell is much more spectrally efficient than a microcell architecture, as the microcells consume at least three non-overlapping channels to provide the coverage that a Virtual Cell offers with just one.
SSID	A 32-character unique identifier attached to the header of packets sent over a WLAN that acts as a name when a mobile device tries to connect to the BSS. (Also called ESSID.) The SSID differentiates one WLAN from another, so all access points and all devices attempting to connect to a specific WLAN must use the same SSID. A device will not be permitted to join the BSS unless it can provide the unique SSID. Because an SSID can be sniffed in plain text from a packet, it does not supply any security to the network. An SSID is also referred to as a Network Name because essentially it is a name that identifies a wireless network.
ssh	Secure SHell. A terminal-emulation program that allows users to log onto a remote device and execute commands. It encrypts the traffic between the client and the host.
SSL	Secure Socket Layer. Commonly used encryption scheme used by many online retail and banking sites to protect the financial integrity of transactions. When an SSL session begins, the server sends its public key to the browser. The browser then sends a randomly generated secret key back to the server in order to have a secret key exchange for that session.
station	Devices such as cellular phones or laptops that need to communicate wirelessly with the Meru Wireless LAN System and do so through **access point**s.
subnetwork or subnet	Found in larger networks, these smaller networks are used to simplify addressing between numerous computers. Subnets connect to the central network through a router, hub or gateway. Each individual Wireless LAN will probably use the same subnet for all the local computers it talks to.
subnet mobility	The ability of a wireless user to roam across Access Points deployed on different subnets using a single IP address.
supplicant	A wireless client that is requesting access to a network.

© 2012 Meru Networks, Inc.

switch A type of hub that efficiently controls the way multiple devices use the same network so that each can operate at optimal performance. A switch acts as a networks traffic cop: rather than transmitting all the packets it receives to all ports as a hub does, a switch transmits packets to only the receiving port.

T

TCP Transmission Control Protocol. A protocol used along with the Internet Protocol (IP) to send data in the form of individual units (called packets) between computers over the Internet. While IP takes care of handling the actual delivery of the data, TCP takes care of keeping track of the packets that a message is divided into for efficient routing through the Internet. For example, when a web page is downloaded from a web server, the TCP program layer in that server divides the file into packets, numbers the packets, and then forwards them individually to the IP program layer. Although each packet has the same destination IP address, it may get routed differently through the network. At the other end, TCP reassembles the individual packets and waits until they have all arrived to forward them as a single file.

TCP/IP The underlying technology behind the Internet and communications between computers in a network. The first part, TCP, is the transport part, which matches the size of the messages on either end and guarantees that the correct message has been received. The IP part is the user's computer address on a network. Every computer in a TCP/IP network has its own IP address that is either dynamically assigned at startup or permanently assigned. All TCP/IP messages contain the address of the destination network as well as the address of the destination station. This enables TCP/IP messages to be transmitted to multiple networks (subnets) within an organization or worldwide.

TKIP Temporal Key Integrity Protocol. An enhancement to the WEP encryption technique that uses a set of algorithms to rotate session keys for better protection. TKIP uses RC4 ciphering, but adds functions such as a 128-bit encryption key, a 48-bit initialization vector, a new message integrity code (MIC), and initialization vector (IV) sequencing rules.

U

USB A high-speed bidirectional serial connection between a PC and a peripheral that transmits data at the rate of 12 megabits per second. The new USB 2.0 specification provides a data rate of up to 480 Mbps, compared to standard USB at only 12 Mbps. 1394, FireWire and iLink all provide a bandwidth of up to 400 Mbps.

UTC Universal Time Coordinated. Also known as Greenwich Mean Time. The time is not adjusted for time zones or for daylight savings time.

V

Virtual Cell Proprietary wireless LAN architecture in which multiple access points are pooled into a single, virtual resource. To the client, APs are indistinguishable because they all use the same BSSID and radio channel . Because clients remain connected to the same virtual AP as they move through a network, no client-initiated handoffs are necessary. Instead, the

© 2012 Meru Networks, Inc.

network itself automatically routes all radio connections through the most appropriate AP. This maximizes bandwidth, simplifies network management and conserves radio spectrum for scalability and redundancy.

Virtual Port An enhancement to the Virtual Cell architecture which partitions the network so that each client device has its own private network with a unique BSSID. From the client's perspective, it gets its own dedicated AP to which it remains connected no matter where it travels in the network. Like a switched Ethernet port, the Virtual Port eliminates latency, jitter and contention for bandwidth as there is only ever one client on each port. Unlike an Ethernet port, it can be personalized to fit each user or device, giving the network control over client behavior with no proprietary client-side software or extensions necessary.

VoFI (Voice over Wi-Fi) or VoWLAN (Voice over Wireless LAN) Voice over IP links that run over a wireless network. VoIP does not usually require high data rates, but it stresses wireless networks in other ways by demanding low latencies and smooth handoffs. In addition, no 802.11n phones yet exist, as most handsets are too small to accommodate MIMO's multiple antennas spaced a wavelength apart. This means that 802.11n networks running VoFI must have a way to deal with 802.11b/g clients.

VLAN Virtual LAN. A logical grouping of devices that enables users on separate networks to communicate with one another as if they were on a single network.

VPN Virtual Private Network. A type of technology designed to increase the security of information transferred over the Internet. VPN can work with either wired or wireless networks, as well as with dial-up connections over POTS. VPN creates a private encrypted tunnel from the end user's computer, through the local wireless network, through the Internet, all the way to the corporate servers and database.

W

WAN Wide Area Network. A communication system of connecting PCs and other computing devices across a large local, regional, national or international geographic area. Also used to distinguish between phone-based data networks and Wi-Fi. Phone networks are considered WANs and Wi-Fi networks are considered Wireless Local Area Networks (WLANs).

WEP Wired Equivalent Privacy. Basic wireless security provided by Wi-Fi. In some instances, WEP may be all a home or small-business user needs to protect wireless data. WEP is available in 40-bit (also called 64-bit), or in 104-bit (also called 128-bit) encryption modes. As 104-bit encryption provides a longer key that takes longer to decode, it can provide better security than basic 40-bit (64-bit) encryption.

Wi-Fi Brand name for wireless LANs based on various 802.11 specifications. All products bearing the Wi-Fi logo have been tested for interoperability by the Wi-Fi Alliance, an industry group composing every major 802.11 client and infrastructure vendor.

WLAN Wireless LAN. Also referred to as LAN. A type of local-area network that uses high-frequency radio waves rather than wires to communicate between nodes.

WME Wireless Multimedia Extension. The Wi-Fi Alliance's standard for QoS based upon the Enhanced Distribution Coordination Function (EDCF), which is a subset of the IEEE 802.11e specification.

WNC Wireless Network Controller. Alternative term for **controller**.

© 2012 Meru Networks, Inc.

WSM Wi-Fi Scheduled Media. The Wi-Fi Alliance's emerging standard for QoS that is based upon the HCF portion of the 802.11e standard, which dedicates bandwidth segments to specific data types. WSM is going to have less of a focus in the enterprise space than its WME counterpart.

WPA Wi-Fi Protected Access. The Wi-Fi Alliance put together WPA as a data encryption method for 802.11 Wireless LANs. WPA is an industry-supported, pre-standard version of 802.11i utilizing the Temporal Key Integrity Protocol (TKIP). WPA will serve until the 802.11i standard is ratified in the third quarter of 2003.

X

X.509 Created by the International Telecommunications Union Telecommunication Standardization Sector (ITU-T), X.509 is the most widely used standard for defining digital certificates.

MERU NETWORKS, INC.
Limited Product Warranty

This Limited Product Warranty applies to the original end-user customer of the Meru product which you purchased for your own use, and not for resale ("Product"), from Meru Networks, Inc. ("Meru") or its authorized reseller ("Reseller").

Limited Warranties

- One-year limited hardware warranty: Meru warrants to you that Meru hardware (other than Third Party Products as described below) will be free from defects in materials and workmanship for a one-year period after the date of delivery of the applicable product to you from Meru or its Reseller (the "Hardware Warranty Period"). If Meru receives written notice from you of such defects during the Hardware Warranty Period, Meru will, at its option, either repair or replace Meru hardware that Meru determines to be defective. Replacement products may be remanufactured units, and will be warranted for the remainder of the original Hardware Warranty Period, or if greater, for thirty days from delivery of such replacement. Should Meru be unable to repair or replace the Meru hardware, Meru (or its Reseller, as applicable) will refund to you the purchase price of the Product.
- 90-Day Limited Software Warranty: Meru warrants to you that, for a 90-day period after the date of delivery of the applicable product to you from Meru or its Reseller (the "Software Warranty Period"), when properly installed and used, (a) the media on which the Meru software is provided will be free from defects in materials or workmanship; and (b) the Meru software will substantially conform to the functional specifications in the applicable documentation. If Meru receives written notice from you of a breach of this warranty during the Software Warranty Period and is able to reproduce the defect, Meru will, at its option, either repair or replace the defective Meru software. Should Meru be unable to repair or replace the Meru software, Meru (or its Reseller, as applicable) will refund to you the purchase price of the Product.

Exclusions

The warranty on the Product shall not apply to defects resulting from the following:

- Alteration or modification of the Product in any way, including without limitation configuration with software or components other than those supplied by Meru or integration with parts other than those supplied by Meru.
- Abuse, damage or otherwise being subjected to problems caused by negligence or misapplication (including without limitation improper or inadequate maintenance or calibration), relocation of the products (including without limitation damage caused by use of other than Meru shipping containers), or use of the products other than as specified in the applicable Meru product documentation (including without limitation incompatible operating environments and systems), or improper site preparation or maintenance.
- Damage as a result of accidents, extreme power surge, extreme electromagnetic field, acts of nature or other causes beyond the control of Meru.

— Use of the Product with software, interfacing, parts or supplies not supplied by Meru.

The warranty on the Product does not apply if the Product is sold, or in the case of software, licensed, for free for evaluation or demonstration purposes.

Meru expressly disclaims any warranty or obligation to support the Product for all operating environments – for example, as illustration and not limitation, Meru does not warrant or ensure interoperability of the Product with future telecommunication systems or other future software or hardware.

You understand and acknowledge that the Products may generate, use or radiate radio frequency energy and may interfere with radio communications and/or radio and television receptions if is not used and/or installed in accordance with the documentation for such products. WHILE MERU USES COMMERCIALLY REASONABLE EFFORTS TO ENSURE COMPLIANCE OF THE PRODUCTS WITH APPLICABLE UNITED STATES FEDERAL COMMUNICATIONS COMMISSION AND PROTECT AGAINST HARMFUL INTERFERENCES, YOU ACKNOWLEDGE AND AGREE THAT INTERFERENCES WITH RADIO COMMUNICATIONS AND/OR RADIO AND TELEVISION RECEPTIONS MAY OCCUR AND THAT MERU WILL NOT BE LIABLE FOR ANY DAMAGES OR INCONVENIENCE BASED ON SUCH INTERFERENCES.

Third Party Products - The above Limited Warranties are exclusive of products manufactured by third parties (“Third Party Products”). If such third party manufacturer provides a separate warranty with respect to the Third Party Product, Meru will include such warranty in the packaging of the Meru Product.

Return procedures

To obtain warranty service you must: (a) obtain a return materials authorization number (“RMA#”) from Meru by contacting rmaadmin@merunetworks.com, and (b) deliver the Product, in accordance with the instructions provided by Meru, along with proof of purchase in the form of a copy of the bill of sale including the Product’s serial number, contact information, RMA# and detailed description of

the defect, in either its original package or packaging providing the Product with a degree of protection equivalent to that of the original packaging, to Meru at the address below. You agree to obtain adequate insurance to cover loss or damage to the Product during shipment.

If you obtain an RMA# and return the defective Product as described above, you agree to bear the cos of returning, and prior to receipt by Meru, you assume risk of any loss or damage to the Product. Meru is responsible for the cost of return shipment to you if the Meru Product is defective.

Returned products which are found by Meru to be not defective, returned out-of-warranty or otherwise ineligible for warranty service will be repaired or replaced at Meru's standard charges and shipped back to you at your expense.

At Meru's sole option, Meru may perform repair service on the Product at your facility, and you agree to provide Meru with all reasonable access to such facility and the Product, as required by Meru. On-site repair service may be available and is governed by the specific terms of your purchase.

All replaced parts, whether under warranty or not, are the property of Meru.

Warranty limitations

THE WARRANTIES SET FORTH ABOVE ARE EXCLUSIVE AND NO OTHER WARRANTY, WHETHER WRITTEN OR ORAL, IS EXPRESSED OR IMPLIED BY MERU, TO THE MAXIMUM EXTENT PERMITTED BY LAW. THERE ARE NO OTHER WARRANTIES RESPECTING THE PRODUCT AND DOCUMENTATION AND SERVICES PROVIDED UNDER THIS AGREEMENT, INCLUDING WITHOUT LIMITATION ANY WARRANTY OF DESIGN, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (EVEN IF MERU HAS BEEN INFORMED OF SUCH PURPOSE), TITLE OR AGAINST INFRINGEMENT OF THIRD PARTY RIGHTS. IF ANY IMPLIED WARRANTY CANNOT BE DISCLAIMED UNDER APPLICABLE LAW, THEN SUCH IMPLIED WARRANTY SHALL BE LIMITED IN DURATION TO THE HARDWARE AND SOFTWARE WARRANTY PERIODS DESCRIBED ABOVE.

NO AGENT OF MERU IS AUTHORIZED TO ALTER OR EXCEED THE WARRANTY OBLIGATIONS OF MERU.

MERU SPECIFICALLY DOES NOT WARRANT THAT THE MERU SOFTWARE WILL BE ERROR FREE OR OPERATE WITHOUT INTERRUPTION.

THE REMEDIES IN THIS LIMITED PRODUCT WARRANTY ARE YOUR SOLE AND EXCLUSIVE REMEDIES, AND MERU'S SOLE AND EXCLUSIVE LIABILITY, FOR BREACH OF THE HARDWARE OR SOFTWARE WARRANTY SET FORTH ABOVE.

Limitations of Liability

You acknowledge and agree that the consideration which you paid to Meru does not include any consideration by Meru of the risk of consequential, indirect or incidental damages which may arise in connection with your use of, or inability to use, the Product. THUS, MERU AND ITS RESELLER WILL NOT BE LIABLE FOR ANY INDIRECT, INCIDENTAL, SPECIAL, PUNITIVE OR CONSEQUENTIAL DAMAGES, INCLUDING WITHOUT LIMITATION LOST PROFITS, LOST BUSINESS, LOST DATA, LOSS OF USE, OR COST OF COVER INCURRED BY YOU ARISING OUT OF OR RELATED TO YOUR PURCHASE OR USE OF, OR INABILITY TO USE, THIS PRODUCT OR THE SERVICES, UNDER ANY THEORY OF LIABILITY, WHETHER IN AN ACTION IN CONTRACT, STRICT LIABILITY, TORT (INCLUDING NEGLIGENCE) OR OTHER LEGAL OR EQUITABLE THEORY, EVEN IF MERU OR ITS RESELLER KNEW OR

SHOULD HAVE KNOWN OF THE POSSIBILITY OF SUCH DAMAGES. IN ANY EVENT, THE CUMULATIVE LIABILITY OF MERU OR ITS RESELLER FOR ALL CLAIMS WHATSOEVER RELATED TO THE PRODUCT OR THE SERVICE WILL NOT EXCEED THE PRICE YOU PAID FOR THE PRODUCT OR SERVICES GIVING RISE TO SUCH CLAIMS.

THE LIMITATIONS SET FORTH HEREIN ARE INTENDED TO LIMIT THE LIABILITY OF MERU AND ITS RESELLERS AND SHALL APPLY NOTWITHSTANDING ANY FAILURE OF ESSENTIAL PURPOSE OF ANY LIMITED REMEDY.

The jurisdiction applicable to you may not allow the limitations of liability or damages set forth above, in which case such limitation shall only apply to you to the extent permitted in such jurisdiction.

Additional Information
This Limited Product Warranty shall be governed by and construed in accordance with the laws of the State of California, U.S.A., exclusive of its conflict of laws principles. The U.N. Convention on Contracts for the International Sale of Goods shall not apply.

This Limited Product Warranty is the entire and exclusive agreement between you and Meru with respect to its subject matter, and any modification or waiver of any provision of this statement is not effective unless expressly set forth in writing by an authorized representative of Meru.

All inquiries or claims made under this Limited Product Warranty must be sent to Meru at the following address:

Meru Networks Inc.,
1309 South Mary Avenue, Sunnyvale, CA 94087, USA
Tel: 408-215-5300
Fax: 408-215-5301
